Chennai, December 18–24, 2008

Program

- 1 Part I. Tensor character of θ
 - NC Coordinates and Twisted Products
 - Moyal Expansion; Drinfeld Twist
 - Twisted Poincaré Action
 - Twisted Covariance; is θ a *Tensor*?
 - Tensor or not? Back to Interpretation!
 - Weyl quantisation requires θ *tensor*
- 2 Part II. From DFR Model to Twisted Covariance
 - DFR coordinates
 - Algebra of generalised symbols
 - DFR C*algebra, and symbol calculus
 - A certain class of localisation states
 - θ – *Universality*
 - Twisted Covariance Recovered
- 3 Interlude: Many Events
- 4 Conclusions

Part I

Tensor character of θ

NC Coordinates and Twisted Products

Commutation Relations: $[q^\mu, q^\nu] = i\theta^{\mu\nu}$, θ fixed once and for all in a given reference frame. Weyl Form:

$$e^{ihq} e^{ikq} = e^{-\frac{i}{2}h\theta k} e^{i(h+k)q}$$

Weyl quantisation:

$$W_\theta(f) = \int dk \check{f}(k) e^{ikq}.$$

Twisted Product defined by:

$$W_\theta(f) W_\theta(g) = W_\theta(f \star_\theta g).$$

Easier to work in momentum space:

$$f \star_\theta g = \widehat{\check{f} \times_\theta \check{g}}$$

where $h\theta k = h_\mu \theta^{\mu\nu} k_\nu = h^t G \theta G k$ and

$$(\check{f} \times_\theta \check{g})(k) = \int dh \check{f}(h) \check{g}(k-h) e^{-\frac{i}{2}h\theta k}.$$

NC Coordinates and Twisted Products

Commutation Relations: $[q^\mu, q^\nu] = i\theta^{\mu\nu}$, θ fixed once and for all in a given reference frame. Weyl Form:

$$e^{ihq} e^{ikq} = e^{-\frac{i}{2}h\theta k} e^{i(h+k)q}$$

Weyl quantisation:

$$W_\theta(f) = \int dk \check{f}(k) e^{ikq}.$$

Twisted Product defined by:

$$W_\theta(f) W_\theta(g) = W_\theta(f \star_\theta g).$$

Easier to work in momentum space:

$$f \star_\theta g = \widehat{\check{f} \times_\theta \check{g}}$$

where $h\theta k = h_\mu \theta^{\mu\nu} k_\nu = h^t G \theta G k$ and

$$(\check{f} \times_\theta \check{g})(k) = \int dh \check{f}(h) \check{g}(k-h) e^{-\frac{i}{2}h\theta k}.$$

Moyal Expansion; Drinfeld Twist

Let's write for the ordinary and twisted convolution

$$c(\check{f} \otimes \check{g})(k) = (\check{f} \times \check{g})(k), \quad c_\theta(\check{f} \otimes \check{g})(k) = (\check{f} \times_\theta \check{g})(k);$$

We define the multiplication operator

$$(T_\theta \check{f} \otimes \check{g})(h, k) = e^{-\frac{i}{2} h \theta k} \check{f}(h) \check{g}(k),$$

fulfilling $T_\theta^{-1} = T_{-\theta}$ and (only on analytic symbols!)

$$(\widehat{T_\theta \check{f} \otimes \check{g}})(x, y) = \left(e^{-\frac{i}{2} \theta^{\mu\nu} \partial_\mu \otimes \partial_\nu} f \otimes g \right)(x, y),$$

so that

$$c_\theta = c \circ T_\theta.$$

We recover position space definition

$$c_\theta(\widehat{f \otimes g}) = m_\theta(f \otimes g) = m(F_\theta f \otimes g).$$

Moyal Expansion; Drinfeld Twist

Let's write for the ordinary and twisted convolution

$$c(\check{f} \otimes \check{g})(k) = (\check{f} \times \check{g})(k), \quad c_\theta(\check{f} \otimes \check{g})(k) = (\check{f} \times_\theta \check{g})(k);$$

We define the multiplication operator

$$(T_\theta \check{f} \otimes \check{g})(h, k) = e^{-\frac{i}{2} h \theta k} \check{f}(h) \check{g}(k),$$

fulfilling $T_\theta^{-1} = T_{-\theta}$ and **(only on analytic symbols!)**

$$(\widehat{T_\theta \check{f} \otimes \check{g}})(x, y) = \left(e^{-\frac{i}{2} \theta^{\mu\nu} \partial_\mu \otimes \partial_\nu} f \otimes g \right)(x, y),$$

so that

$$c_\theta = c \circ T_\theta.$$

We recover position space definition

$$c_\theta(\widehat{f \otimes g}) = m_\theta(f \otimes g) = m(F_\theta f \otimes g).$$

Moyal Expansion; Drinfeld Twist

Let's write for the ordinary and twisted convolution

$$c(\check{f} \otimes \check{g})(k) = (\check{f} \times \check{g})(k), \quad c_\theta(\check{f} \otimes \check{g})(k) = (\check{f} \times_\theta \check{g})(k);$$

We define the multiplication operator

$$(T_\theta \check{f} \otimes \check{g})(h, k) = e^{-\frac{i}{2} h \theta k} \check{f}(h) \check{g}(k),$$

fulfilling $T_\theta^{-1} = T_{-\theta}$ and **(only on analytic symbols!)**

$$(\widehat{T_\theta \check{f} \otimes \check{g}})(x, y) = \left(e^{-\frac{i}{2} \theta^{\mu\nu} \partial_\mu \otimes \partial_\nu} f \otimes g \right)(x, y),$$

so that

$$c_\theta = c \circ T_\theta.$$

We recover position space definition

$$c_\theta(\widehat{f \otimes g}) = m_\theta(f \otimes g) = m(F_\theta f \otimes g).$$

Moyal Expansion; Drinfeld Twist

Let's write for the ordinary and twisted convolution

$$c(\check{f} \otimes \check{g})(k) = (\check{f} \times \check{g})(k), \quad c_\theta(\check{f} \otimes \check{g})(k) = (\check{f} \times_\theta \check{g})(k);$$

We define the multiplication operator

$$(T_\theta \check{f} \otimes \check{g})(h, k) = e^{-\frac{i}{2} h \theta k} \check{f}(h) \check{g}(k),$$

fulfilling $T_\theta^{-1} = T_{-\theta}$ and **(only on analytic symbols!)**

$$(\widehat{T_\theta \check{f} \otimes \check{g}})(x, y) = \left(e^{-\frac{i}{2} \theta^{\mu\nu} \partial_\mu \otimes \partial_\nu} f \otimes g \right)(x, y),$$

so that

$$c_\theta = c \circ T_\theta.$$

We recover position space definition

$$c_\theta(\widehat{f \otimes g}) = m_\theta(f \otimes g) = m(F_\theta f \otimes g).$$

Twisted Poincaré Action

Define

$$(\alpha(L)\check{f})(k) = e^{-ika}\check{f}(L^{-1}k), \quad L \in \mathcal{P}$$

(Fourier Transform of $f \mapsto {}_L f(x) = f(L^{-1}x)$).

Twisted product not covariant in general (θ constant):

$$\alpha(L)c_\theta(\check{f} \otimes \check{g}) \neq c_\theta(\alpha(L)\check{f} \otimes \alpha(L)\check{g}).$$

Solution (Chaichian & cols, Wess & cols): twist the coproduct action: namely replace $\alpha^{(2)}(L) = \alpha(L) \otimes \alpha(L)$ by

$$\alpha_\theta^{(2)}(L) = T_\theta^{-1} \alpha^{(2)}(L) T_\theta.$$

Is an action:

$$\begin{aligned} \alpha^{(2)}(L)\alpha^{(2)}(M) &= T_\theta^{-1} \alpha^{(2)}(L) T_\theta T_\theta^{-1} \alpha^{(2)}(M) T_\theta = \\ &= T_\theta^{-1} \alpha^{(2)}(L)\alpha^{(2)}(M) T_\theta = \alpha_\theta^{(2)}(LM). \end{aligned}$$

Twisted Poincaré Action

Define

$$(\alpha(L)\check{f})(k) = e^{-ika}\check{f}(L^{-1}k), \quad L \in \mathcal{P}$$

(Fourier Transform of $f \mapsto {}_L f(x) = f(L^{-1}x)$).

Twisted product not covariant in general (θ constant):

$$\alpha(L)c_\theta(\check{f} \otimes \check{g}) \neq c_\theta(\alpha(L)\check{f} \otimes \alpha(L)\check{g}).$$

Solution (Chaichian & cols, Wess & cols): twist the coproduct action: namely replace $\alpha^{(2)}(L) = \alpha(L) \otimes \alpha(L)$ by

$$\alpha_\theta^{(2)}(L) = T_\theta^{-1} \alpha^{(2)}(L) T_\theta.$$

Is an action:

$$\begin{aligned} \alpha^{(2)}(L)\alpha^{(2)}(M) &= T_\theta^{-1} \alpha^{(2)}(L) T_\theta T_\theta^{-1} \alpha^{(2)}(M) T_\theta = \\ &= T_\theta^{-1} \alpha^{(2)}(L)\alpha^{(2)}(M) T_\theta = \alpha_\theta^{(2)}(LM). \end{aligned}$$

Twisted Covariance; is θ a Tensor?

Easy to check that

$$\alpha(L)c_\theta(\check{f} \otimes \check{g}) = c_\theta(\alpha_\theta^{(2)}(L)\check{f} \otimes \check{g}). \quad (*)$$

Standard interpretation: θ **not a tensor!** Is that obvious? Other way to check (*). Set $\theta' = \Lambda\theta\Lambda^t$ ($\theta'^{\mu\nu} = \Lambda^\mu{}_{\mu'}\Lambda^{\nu'}{}_{\nu}\theta^{\mu'\nu'}$). Remark that

$$\alpha^{(2)}(L)T_\theta = T_{\theta'}\alpha^{(2)}(L)$$

[$h^t G \theta G k \mapsto (\Lambda^{-1}h)^t G \theta G \Lambda^{-1}k$, use $\Lambda^{-1} = G\Lambda^t G$, $G^2 = 1$.]

so that $\alpha_\theta^{(2)}(L) = T_\theta^{-1}\alpha^{(2)}(L)T_\theta = T_\theta^{-1}T_{\theta'}\alpha^{(2)}(L)$ and

$$\begin{aligned} c_\theta(\alpha_\theta^{(2)}(L)\check{f} \otimes \check{g}) &= c(T_\theta\alpha_\theta^{(2)}(L)\check{f} \otimes \check{g}) = c(T_\theta T_\theta^{-1}T_{\theta'}\alpha^{(2)}(L)\check{f} \otimes \check{g}) = \\ &= c_{\theta'}(\check{f}' \otimes \check{g}') = \check{f}' \times_{\theta'} \check{g}'. \end{aligned}$$

where $\check{f}'(k) = e^{-ika}\check{f}(\Lambda^{-1})$. in other words:

(twstd covariance + θ invariant) \Leftrightarrow (ordinary cov'nce + θ tensor):

$$(f \star_\theta g)' = f' \star_{\theta'} g'.$$

Twisted Covariance; is θ a Tensor?

Easy to check that

$$\alpha(L)c_\theta(\check{f} \otimes \check{g}) = c_\theta(\alpha_\theta^{(2)}(L)\check{f} \otimes \check{g}). \quad (*)$$

Standard interpretation: θ **not a tensor**! Is that obvious? Other way to check (*). Set $\theta' = \Lambda\theta\Lambda^t$ ($\theta'^{\mu\nu} = \Lambda^\mu_{\mu'}\Lambda^{\nu'}_{\nu}\theta^{\mu'\nu'}$). Remark that

$$\alpha^{(2)}(L)T_\theta = T_{\theta'}\alpha^{(2)}(L)$$

[$h^t G \theta G k \mapsto (\Lambda^{-1}h)^t G \theta G \Lambda^{-1}k$, use $\Lambda^{-1} = G\Lambda^t G$, $G^2 = 1$.]

so that $\alpha_\theta^{(2)}(L) = T_\theta^{-1}\alpha^{(2)}(L)T_\theta = T_\theta^{-1}T_{\theta'}\alpha^{(2)}(L)$ and

$$\begin{aligned} c_\theta(\alpha_\theta^{(2)}(L)\check{f} \otimes \check{g}) &= c(T_\theta\alpha_\theta^{(2)}(L)\check{f} \otimes \check{g}) = c(T_\theta T_\theta^{-1}T_{\theta'}\alpha^{(2)}(L)\check{f} \otimes \check{g}) = \\ &= c_{\theta'}(\check{f}' \otimes \check{g}') = \check{f}' \times_{\theta'} \check{g}'. \end{aligned}$$

where $\check{f}'(k) = e^{-ika}\check{f}(\Lambda^{-1})$. in other words:

(twstd covariance + θ invariant) \Leftrightarrow (ordinary cov'nce + θ tensor):

$$(f \star_\theta g)' = f' \star_{\theta'} g'.$$

Twisted Covariance; is θ a Tensor?

Easy to check that

$$\alpha(L)c_\theta(\check{f} \otimes \check{g}) = c_\theta(\alpha_\theta^{(2)}(L)\check{f} \otimes \check{g}). \quad (*)$$

Tensor or not? Back to Interpretation!

Untwisted form covariance + tensoriality of θ may seem appealing, but form covariance alone not a guidance, when equivalence of observers is broken at a fundamental level. Up to now the two formalisms have same dignity.

Problem is: above only formal remark. To decide, go back to interpretation of $i\theta$ as the commutator of the coordinates.

Assume Jack=preferred observer, Jane=observer connected to Jack by L .

Jane:

- $[q'^{\mu}, q'^{\nu}] = ?$ (no a priori assumption),
- $W'(f) = \int dk \check{Y}(k) e^{ikq'}$ (same physics),
- $W'(m_{\theta}(\alpha_{\theta}^{(2)}(f \otimes g))) = W'(f)W'(g)$ (twstd cov).

Tensor or not? Back to Interpretation!

Weyl quantisation requires θ tensor

We first compute ($L = (\Lambda, 0)$ for simplicity))

$$\begin{aligned} W'(f')W(g') &= \left(\int dh \check{f}'(h) e^{ihq'} \right) \left(\int dk \check{g}'(k) e^{ikq'} \right) = \\ &= \int dh \int dk \check{f}'(h) \check{g}'(k) e^{ihq'} e^{ikq'}, \end{aligned}$$

$$\begin{aligned} W'(m_\theta(\alpha_\theta^{(2)}))(f \otimes g) &= \int dk e^{ikq'} \int dh e^{-\frac{i}{2}h\theta k} e^{\frac{i}{2}(h\theta k - h\theta'k)} \\ &\quad \check{f}'(h) \check{g}'(k-h) = \\ &= \int dk e^{i(h+k)q'} \int dh \check{f}'(h) \check{g}'(k) e^{-\frac{i}{2}h\theta'(k+h)} \end{aligned}$$

where $\theta'^{\mu\nu} = \Lambda^\mu_{\mu'} \Lambda^\nu_{\nu'} \theta^{\mu'\nu'}$. It follows

$$e^{ihq'} e^{ikq'} = e^{-\frac{i}{2}h\theta k} e^{i(h+k)q'},$$

i.e. the Weyl form of $[q'^{\mu}, q'^{\nu}] = i\theta'^{\mu\nu}$. Conclusion: θ is a tensor!

Weyl quantisation requires θ tensor

We first compute ($L = (\Lambda, 0)$ for simplicity)

$$\begin{aligned} W'(f')W(g') &= \left(\int dh \check{f}'(h) e^{ihq'} \right) \left(\int dk \check{g}'(k) e^{ikq'} \right) = \\ &= \int dh \int dk \check{f}'(h) \check{g}'(k) e^{ihq'} e^{ikq'}, \end{aligned}$$

$$\begin{aligned} W'(m_\theta(\alpha_\theta^{(2)})(f \otimes g)) &= \int dk e^{ikq'} \int dh e^{-\frac{i}{2}h\theta k} e^{\frac{i}{2}(h\theta k - h\theta'k)} \\ &\quad \check{f}'(h) \check{g}'(k-h) = \\ &= \int dk e^{i(h+k)q'} \int dh \check{f}'(h) \check{g}'(k) e^{-\frac{i}{2}h\theta'(k+h)} \end{aligned}$$

where $\theta'^{\mu\nu} = \Lambda^\mu_{\mu'} \Lambda^\nu_{\nu'} \theta^{\mu'\nu'}$. It follows

$$e^{ihq'} e^{ikq'} = e^{-\frac{i}{2}h\theta k} e^{i(h+k)q'},$$

i.e. the Weyl form of $[q'^{\mu}, q'^{\nu}] = i\theta'^{\mu\nu}$. Conclusion: θ is a tensor!

Weyl quantisation requires θ tensor

We first compute ($L = (\Lambda, 0)$ for simplicity)

We first compute ($L = (\Lambda, 0)$ for simplicity))

$$\begin{aligned} W'(f')W(g') &= \left(\int dh \check{f}'(h) e^{ihq'} \right) \left(\int dk \check{g}'(k) e^{ikq'} \right) = \\ &= \int dh \int dk \check{f}'(h) \check{g}'(k) e^{ihq'} e^{ikq'}, \end{aligned}$$

$$\begin{aligned} W'(m_\theta(\alpha_\theta^{(2)}))(f \otimes g) &= \int dk e^{ikq'} \int dh e^{-\frac{i}{2}h\theta k} e^{\frac{i}{2}(h\theta k - h\theta' k)} \\ &\quad \check{f}'(h) \check{g}'(k - h) = \\ &= \int dk e^{i(h+k)q'} \int dh \check{f}'(h) \check{g}'(k) e^{-\frac{i}{2}h\theta'(k+h)} \end{aligned}$$

where $\theta'^{\mu\nu} = \Lambda^\mu_{\mu'} \Lambda^\nu_{\nu'} \theta^{\mu'\nu'}$. It follows

$$e^{ihq'} e^{ikq'} = e^{-\frac{i}{2}h\theta k} e^{i(h+k)q'},$$

i.e. the Weyl form of $[q'^\mu, q'^\nu] = i\theta'^{\mu\nu}$. **Conclusion: θ is a tensor!**

Part II

From DFR Model

to

Twisted Covariance

DFR coordinates

∃! the regular representation of the relations

$$[q^\mu, q^\nu] = iQ^{\mu\nu}, \quad [q^\mu, Q^{\nu,\rho}] = 0,$$

where

$$\text{jSp}(Q) = \Sigma = \{\sigma : \sigma = \Lambda \sigma_0 \Lambda^t, \Lambda \in \mathcal{L}\}.$$

Motivations: cf preceding talk. Covariance:

$$\begin{aligned} U(\mathbf{a}, \Lambda)^{-1} q^\mu U(\mathbf{a}, \Lambda) &= \Lambda^\mu_{\mu'} q^{\mu'} + \mathbf{a}^\mu, \\ U(\mathbf{a}, \Lambda)^{-1} Q^{\mu\nu} U(\mathbf{a}, \Lambda) &= \Lambda^\mu_{\mu'} \Lambda^\nu_{\nu'} Q^{\mu'\nu'}. \end{aligned}$$

Weyl quantisation:

$$W(f) = \int dk \check{f}(k) e^{ikq}.$$

Problem with twisted product: they depend on an operator Q , not on a C-number matrix. Need more general symbols.

Algebra of generalised symbols

Symbol in Fourier space:

$$\varphi : \Sigma \rightarrow L^1(\mathbb{R}^4) \text{ continuous, vanish at } \infty$$

Generalised twisted product:

$$(\varphi \tilde{\times} \psi)(\sigma; k) = \int dk \varphi(\sigma; h) \psi(\sigma; k - h) e^{-\frac{i}{2} h \sigma k}$$

Involution and norm:

$$\|\varphi\| = \sup_{\sigma} \|\varphi(\sigma; \cdot)\|_{L^1}, \quad \varphi^*(\sigma; k) = \overline{\varphi(\sigma; -k)}.$$

Action of Poincaré group:

$$(\alpha(a, \Lambda)\varphi)(\sigma; k) = (\det \Lambda) e^{-ika} \varphi(\Lambda^{-1} \sigma \Lambda^{-1t}; \Lambda^{-1} k).$$

N.B. maps each fibre over σ onto the fibre onto $\sigma' = \Lambda \sigma \Lambda^t$

Algebra of generalised symbols

Symbol in Fourier space:

$$\varphi : \Sigma \rightarrow L^1(\mathbb{R}^4) \text{ continuous, vanish at } \infty$$

Generalised twisted product:

Action of Poincaré group:

$$(\alpha(\mathbf{a}, \Lambda)\varphi)(\sigma; k) = (\det \Lambda) e^{-i k \mathbf{a}} \varphi(\Lambda^{-1} \sigma \Lambda^{-1 t}; \Lambda^{-1} k).$$

N.B. maps each fibre over σ onto the fibre onto $\sigma' = \Lambda \sigma \Lambda^t$.

DFR C^* algebra, and symbol calculus

Theorem [DFR 95]; there is a unique C^* -norm; the corresponding C^* -completion is isomorphic (as a continuous field of C^* -algebras) to $C_0(\Sigma, \mathcal{K})$, \mathcal{K} =compact operators.

Representation of the algebra:

$$\pi(\varphi) = \int dk \varphi(Q; k) e^{ikq}$$

(replacement $\sigma \rightarrow Q$ understood as functional calculus).

Relation with Weyl quantisation:

$$W(f) = \pi(\check{f}).$$

Symbol calculus:

$$\begin{aligned} W(f)W(g) &= W(f \star_Q g), \\ (f \star_Q g)(k) &= (\check{f} \tilde{\times} \check{g})(Q; k). \end{aligned}$$

A certain class of localisation states

A localisation state is a linear functional formally written as

$$\varphi \mapsto \iint d\sigma dk K(\sigma; k)\varphi(\sigma; k)$$

with K such to ensure positivity and normalisation. We are interested in states with kernel of the form

$$K(\sigma; k) = \delta(\sigma - \theta)w(k),$$

which give

$$\varphi \mapsto \int dk w(k)\varphi(\theta; k)$$

More cleanly: we define the projection on the fibre over θ :

$$\Pi_\theta[\varphi](k) = \varphi(\theta; k);$$

extend it by continuity to a map $\Pi_\theta : \mathcal{C}(\Sigma, \mathcal{K}) \rightarrow \mathcal{K}$. Then we are interested in the states of the form $\omega \circ \Pi_\theta$ with $\omega \in \mathcal{S}(\mathcal{K})$.

A certain class of localisation states

extend it by continuity to a map $\Pi_\theta : \mathcal{C}(\Sigma, \mathcal{K}) \rightarrow \mathcal{K}$. Then we are interested in the states of the form $\omega \circ \Pi_\theta$ with $\omega \in \mathcal{S}(\mathcal{K})$.

θ -Universality

We now make an additional assumption: while in the DFR model all localisation states are available to each observer,

θ -universality.

- There is a privileged class of observers;
- The privileged observers are connected by Λ 's in the stabiliser of θ ;
- The only available localisation states are those which, in the reference frame of a privileged observer, are of the form $\omega \circ \Pi_\theta$, where $\omega \in \mathcal{S}(\mathcal{K})$;

Unprivileged observers connected to privileged observers by some Λ only may localise with states of the form $\omega \circ \Pi_{\theta'}$, where $\theta' = \Lambda\theta\Lambda^t$.

Unprivileged observers connected to privileged observers by some Λ only may localise with states of the form $\omega \circ \Pi_{\theta'}$, where $\theta' = \Lambda\theta\Lambda^t$.

Twisted Covariance Recovered

The privileged observer can test the algebra only at θ ; he only sees θ -twisted products:

$$\Pi_{\theta}\varphi \tilde{\times} \psi = (\Pi_{\theta}\varphi) \times_{\theta} (\Pi_{\theta}\psi)$$

Let

$$\varphi'(\sigma; k) = (\det \Lambda)\varphi(\Lambda^{-1}\sigma\Lambda^{-1t}; \Lambda^{-1}k)$$

be the Lorentz transform of φ , and analogously for ψ' ; the (possibly) unprivileged primed observer only sees the fibre over $\theta' = \Lambda\theta\Lambda^t$:

$$(\Pi_{\theta'}\varphi')(k) = \varphi'(\theta'; k) = (\det \Lambda)\varphi(\theta; \Lambda^{-1}k),$$

as expected. Finally the primed observer only sees θ' -twisted products:

$$\Pi_{\theta'}(\varphi' \tilde{\times} \psi') = (\Pi_{\theta'}\varphi') \times_{\theta'} (\Pi_{\theta'}\psi').$$

Twisted Covariance Recovered

Interlude

Many Events

Many Events

Different inequivalent possibilities for defining polylocal products:

- Translations: $f(q)f(q + a_2)f(q + a_3) \cdots$; investigated in DFR. Feature: they depend on one single localisation state.
- Independent coordinates: $[q_j^\mu, q_k^\mu] = i\delta_{jk}Q^{\mu\nu}$; investigated in P,BDFP. They naturally lead to ultraviolet finite theories. Note that $[q_j, q_j] = iQ$ does not depend on j ; corresponds to tensor products of Z -moduli. Irreps:

$$q_1 = q_\sigma \otimes l \otimes l \cdots, \quad q_2 = l \otimes q_\sigma \otimes \cdots, \quad \cdots$$

fulfil $[q_j, q_k] = i\delta_{jk}\sigma$.

- Fiore Wess:

$$[q_j^\mu, q_k^\nu] = i\theta^{\mu\nu}$$

(no δ_{jk})

“No Relations without Representation!”

Problem with Fiore Wess coordinates: assume q_j **regular** irrep, then:

$$[q_j^\mu, (q_k - q_l)^\nu] = 0 \quad \text{strongly}$$

hence by Schur's Lemma:

$$q_k - q_l = b_{kl} \in \mathbb{R}^4.$$

Set

$$a_j = b_{j1}$$

so that

$$q_j = q_1 + a_j$$

There is only one set of 4 coordinates; all the other sets are just translates of the basic coordinates of a single event.

Conclusions

Conclusions 1

We have shown that (twisted covariance + θ invariant) is equivalent to (untwisted covariance + θ covariant), and given an argument in favour of the latter, based on physical interpretation.

Moreover, we have seen that the latter is equivalent to (DFR model + θ -universality).

Now one may raise the question: which are the physical motivations for restricting the admissible localisation states? Namely why θ ?

Conclusions 1

Conclusions 2

Let me more precise by means of a trivial example: consider Newton laws for motions of a point mass in the 3-space. Let's say that we state z -universality: the preferred observers only can see motions with $z(0) > 0$. Then we may distinguish the privileged observers from unprivileged ones; e.g. Jane, who is rotated by 180° around x axis, only sees $z'(0) < 0$.

The principle of relativity requires instead that, together with each admissible state, all the states which can be reached by a symmetry of the system must be available to all observers, including the privileged ones.

In the same way, on QST every observer should reach any θ' together with θ .

To say it differently, it is not sufficient that the set of admissible localisation states is form-covariant; it must be invariant.
