September 2013
Homi Bhabha National Institute

Recommendations of the Viva Voce Board

As members of the Viva Voce Board, we certify that we have read the dissertation prepared by Panchugopal Bikram entitled “Extendable Endomorphisms of Factors” and recommend that it may be accepted as fulfilling the dissertation requirement for the Degree of Doctor of Philosophy.

Guide/Convenor/Chairman - V. S. Sunder

Member 1 - Vijay Kodiyalam

Member 2 - Krishna Maddaly

Member 3 - Amritanshu Prasad

External Examiner - B V Rajarama Bhat

Final approval and acceptance of this dissertation is contingent upon the candidate’s submission of the final copies of the dissertation to HBNI.

I hereby certify that I have read this dissertation prepared under my direction and recommend that it may be accepted as fulfilling the dissertation requirement.

STATEMENT BY AUTHOR

This dissertation has been submitted in partial fulfillment of requirements for an advanced degree at Homi Bhabha National Institute (HBNI) and is deposited in the Library to be made available to borrowers under rules of the HBNI.

Brief quotations from this dissertation are allowable without special permission, provided that accurate acknowledgement of source is made. Requests for permission for extended quotation from or reproduction of this manuscript in whole or in part may be granted by the Competent Authority of HBNI when in his or her judgment the proposed use of the material is in the interests of scholarship. In all other instances, however, permission must be obtained from the author.

Panchugopal Bikram
DECLARATION

I hereby declare that this thesis entitled “Extendable Endomorphisms of Factors” submitted by me for the degree of Doctor of Philosophy in Mathematics is the record of original work done by me under the supervision of Professor V. S. Sunder during the period 2008 to 2013. The work is original and has not been submitted earlier as a whole or in part of a degree/diploma at this or any other Institution/University.

Panchugopal Bikram
ACKNOWLEDGEMENTS

First of all, I would like to express my deep gratitude to my advisor V. S. Sunder who is more than a teacher to me. He has always encouraged me and helped me with wonderful insights and ideas whenever needed. Without his help this thesis would never have seen the light of the day.

I am extremely grateful to R. Srinivasan who is like my co-advisor from Chennai Mathematical Institute. Right from my beginning of the study of my research topics, he was always there with the best possible suggestion for me with a friendly smile.

I thank all the academic, administrative and technical members of the Institute of Mathematical Sciences for giving a conducive environment to pursue research.

I will thank my office mates Arijit, Sarbeswar, Tuhin, Dhriti, Prateep, Suratno who made my life easier during these years with wonderful companion and lively discussions both mathematical and non-mathematical. I thank my friends for keeping my spirits high throughout, specially Kunal, Madhushree for helpful discussions. I thank all the students of IMSc that I have met during my stay here, for keeping up the comfortable friendly environment within this institute.

Finally, I greatly appreciate the patience and unconditional love that I have received over the years from my family and this thesis is dedicated to my supernal father whom I have lost during these days.

Panchugopal

Synopsis

This thesis is devoted to the study of weak-* continuous semigroups of unital normal *-endomorphisms on arbitrary factors. It is divided into three chapters. The first chapter proposes a rephrasing of the notion of a Hilbert von Neumann module, while the last two chapters are dedicated to a class of endomorphisms and $E_0$-semigroups on factors which we call extendable. These three chapters are more or less the content of the three papers labeled a, b, and c, in my list of publications.

Hilbert von Neumann modules

In the first chapter we rephrase the notion of Hilbert von Neumann modules as spaces of operators between Hilbert space, not unlike [Ske01], but in a seemingly simpler manner and involving far less machinery.

- If $A_2$ is a von Neumann algebra, a Hilbert von Neumann $A_2$-module is a tuple $\mathcal{E} = (E, \mathcal{H}_1, (\pi_2, \mathcal{H}_2))$ where $E$ is a weakly closed subspace of $\mathcal{B}(\mathcal{H}_2, \mathcal{H}_1)$ with $E \supset EE^*E$, equipped with a normal isomorphism $\pi_2 : A_2 \to [E^*E]^1$.

- If $A_1, A_2$ are von Neumann algebras, a Hilbert von Neumann $A_1 - A_2$ bimodule is a tuple $\mathcal{E} = (E, (\pi_1, \mathcal{H}_1), (\pi_2, \mathcal{H}_2))$ comprising a Hilbert von Neumann $A_2$-module $(E, \mathcal{H}_1, (\pi_2, \mathcal{H}_2))$ equipped with a normal unital homomorphism $\pi_1 : A_1 \to [EE^*]$.

We then revisit the proof, in our formulation, of the ‘Riesz lemma’ or what is called ‘self-duality’ in [Ske01] and establish the analogue of the Stinespring dilation theorem for Hilbert von Neumann bimodules.

We develop our version of ‘internal tensor products’ (which we refer to as Connes fusion for obvious reasons) in the following way. Suppose $\mathcal{E} = (E, (\pi_1, \mathcal{H}_1), (\pi_2, \mathcal{H}_2))$ is a

\footnote{We shall always use the following notation: if $S \subset \mathcal{H}$ (resp., $S \subset \mathcal{B}(\mathcal{M}, \mathcal{K})$ and $T \subset \mathcal{B}(\mathcal{H}, \mathcal{M})$, then $[S]$ (resp., $[S]$) is the norm-, equivalently weakly (resp., $SOT$, equivalently $WOT$) closed subspace spanned by $S$ (resp., $S$); whereas $S^*T = \{x^*y : x \in S, y \in T\}$.}
Hilbert von Neumann $A_1 - A_2$ - bimodule and $\mathcal{F} = (F, (\rho_2, K_2), (\rho_3, K_3))$ is a Hilbert von Neumann $A_2 - A_3$ - bimodule. We know that the normal representation $\rho_2$ of $A_2$ is equivalent to a sub-representation of an infinite ampliation of the faithful normal representation $\pi_2$ of $A_2$; thus there exists an $A_2$ - linear isometry $u : K_2 \to \mathcal{H}_2 \otimes \ell^2$: i.e., $u^* u = id_{K_2}$ and $u \rho_2(x) = (\pi_2(x) \otimes id_{\ell^2}) u \forall x \in A_2$. It follows that $p = uu^* \in (\pi_2(A_2) \otimes id_{\ell^2})'$. Now, set $p = uu^*$ and then there exists a naturally associated projection $q \in P(\pi_1(A_1)')$ (by a sort of push-forward construction). Then, if $x \in E, y \in F$, define $x \odot y$ to be the composite operator

$$K_3 \xrightarrow{x \otimes y} q(\mathcal{H}_1 \otimes \ell^2) =: K_3 \xrightarrow{y} K_2 \xrightarrow{u} uu^*(\mathcal{H}_2 \otimes \ell^2) \xrightarrow{x \otimes id_{\ell^2}} q(\mathcal{H}_1 \otimes \ell^2),$$

set $E \odot F = \{ x \odot y : x \in E, y \in F \}$; and finally define the Connes fusion of $\mathcal{E}$ and $\mathcal{F}$ to be

$$\mathcal{E} \otimes_{A_2} \mathcal{F} =: (E \odot F, (q(\pi_1 \otimes id_{\ell^2})|_{ran \ q}, q(\mathcal{H}_1 \otimes \ell^2), (\rho_3, K_3)).$$

Then we verify that the Connes fusion of two Hilbert von Neumann bimodules is again a Hilbert von Neumann bimodule.

In the section of examples of this chapter we relate Jones’ basic construction to the Stinespring dilation associated to the conditional expectation onto a finite-index inclusion.

Suppose $(M, \mathcal{H}, J, P)$ is a standard form of $M$ in the sense of [Haa75]. As indicated in [Haa75], there is then a canonical ‘implementing’ unitary representation

$$Aut(M) \ni \theta \mapsto u_\theta \in \mathcal{L}(\mathcal{H})$$

satisfying $u_\theta x u_\theta^* = \theta(x) \forall x \in M$. We have the natural Hilbert von Neumann $M - M$ bimodule given by

$$\mathcal{E}_\theta = (Mu_\theta, (id_M, L^2(M)), (id_M, L^2(M))).$$

Then we prove that
Connes fusion corresponds to composition’ in this case, in the sense that if \( \theta, \phi \in \text{Aut}(M) \), then
\[
E_{\theta} \otimes_M E_{\phi} \cong E_{\theta \phi} :
\]
and further, that

- If \( \theta, \phi \in \text{Aut}(M) \), then \( E_{\theta} \cong E_{\phi} \) if and only if \( \theta \) and \( \phi \) are inner conjugate.

On extendability of endomorphisms and of \( E_0 \)-semigroups on factors

In this chapter we study what it means to say that certain endomorphisms of a factor (which we call equi-modular) are extendable.

Let \( \phi \) be a faithful normal state on a factor \( M \) and \( J \) be the modular conjugation operator corresponding to the state \( \phi \). Let \( \theta \) be a normal unital *-endomorphism which preserves \( \phi \). The invariance assumption \( \phi \circ \theta = \phi \) implies that there exists a unique isometry \( u_{\theta} \) on \( L^2(M, \phi) \) such that \( u_{\theta}x \hat{1}_M = \theta(x) \hat{1}_M \) and equivalently, that \( u_{\theta}x = \theta(x)u_{\theta} \forall x \in M \) and \( u_{\theta} \hat{1}_M = \hat{1}_M \). In this chapter we study certain properties of the following endomorphisms.

- If \( M, \phi, \theta \) are as above, and if the associated isometry \( u_{\theta} \) of \( L^2(M, \phi) \) commutes with the modular conjugation operator \( J \), we shall say \( \theta \) is an equi-modular endomorphism of the factorial non-commutative probability space \( (M, \phi) \).

Then we note the following simple consequences of \( \theta \) being an equi-modular endomorphism.

- The equation \( \theta' = j \circ \theta \circ j \) defines a unital normal *-endomorphism of \( M' \) which preserves \( \phi' = \overline{\phi \circ j} \), where \( j = J(\cdot)J \) is a *-preserving conjugate-linear isomorphism of \( \mathcal{L}(L^2(M, \phi)) \) onto itself; and
• We have an identification

\[ L^2(M', \phi') = L^2(M, \phi) \]

\[ \widehat{1_{M'}} = \widehat{1_M} \]

\[ u_{\theta'} = u_\theta \]

• there exists a unique endomorphism \( \theta^{(2)} \) of \( L(L^2(M, \phi)) \) satisfying

\[ \theta^{(2)}(xj(y)) = \theta(x)j(\theta(y))z, \ \forall x, y \in M \]

where \( z = \wedge\{p \in (\theta(M) \cup \theta'(M'))'' : \text{ran}(p) \supset \{\widehat{\theta(x)} : x \in M\}\} \).

It turns out that equi-modularity of \( \theta \) forces \( \theta(M)\widehat{1_M} \) to be globally invariant under the modular group \( \sigma^\phi \) and consequently there exists a faithful normal \( \phi \)-preserving conditional expectation of \( M \) onto \( \theta(M) \). Let \( P = \theta(M) \subset M \subset P_1 \) be the Jones’ basic construction (thus, \( P_1 = JP\sigma J \) and the Jones projection is given by \( e_\theta = u_\theta u_\theta^* \)). Then we prove that the following statements are equivalent for equi-modular endomorphisms.

• there exists a unique unital normal \(*\)-endomorphism \( \theta^{(2)} \) of \( L(L^2(M, \phi)) \) such that

\[ \theta^{(2)}(x) = \theta(x) \text{ and } \theta^{(2)}(j(x)) = j(\theta(x)) \text{ for all } x \in M. \]

• \( P \vee JPJ \) is a factor; and in this case, it is necessarily a type \( I \) factor.

• \( (P \vee JPJ)' = P' \cap P_1 \) is a factor; and in this case, it is necessarily a type \( I \) factor.

• \( \{x\widehat{y} : x \in P' \cap P_1, y \in P\} \) is total in \( L^2(M, \phi) \).

• \( M = (M \cap \theta(M')) \vee \theta(M) \). (Note that the right-hand side is naturally identified with the von Neumann algebra tensor product \( (M \cap \theta(M')) \otimes \theta(M) \) in this case.)

An endomorphism of a factor which satisfies the equivalent conditions above will be said to be extendable. Then we exhibit some examples of extendable endomorphisms on a McDuff factor.
In the next section of this chapter we discuss extendability of $E_0$-semigroups on factors. An $E_0$-semigroup $\alpha = \{\alpha_t : t \geq 0\}$ on a factorial probability space $(M, \phi)$ is said to be extendable if for every $t \geq 0$, $\alpha_t$ is extendable. We show that extendability of an $E_0$-semigroup is cocycle conjugacy invariant. Then we make a note that CCR flows on type $III$ factors arising from some quasi-free states are examples of extendable $E_0$-semigroups while the Clifford flow on the hyperfinite $II_1$ factor is not extendable. We also observe that free flows on free group factors $LF_\infty$ are not extendable.

Alexis Alevras in [Ale04] proved that Clifford flow and CAR flow on the hyperfinite $II_1$ factor are cocycle conjugate. We conclude that the CAR flow on the hyperfinite $II_1$ is not extendable. In the end of this section we point out an error in the authors’ claim in [ABS01] that the Clifford flow is extendable. (They state this in terms of a notion they call regularity which is close to our notion of extendability.)

**CAR flows on type $III$ factors**

This chapter is dedicated to studying extendability of CAR flows on type $III$ factors. Let $\mathcal{H} = L^2(0, \infty) \otimes \mathcal{K}$, where $\mathcal{K}$ is any Hilbert space and $\mathcal{A}$ be the CAR algebra over $\mathcal{H}$. Every positive contraction $R$ on $\mathcal{B}(\mathcal{H})$ determines a so-called quasi-free state $\omega_R$ on $\mathcal{A}$. Let $(\pi_R, \mathcal{H}_R, \Omega_R)$ be the GNS triple for the $C^*$-algebra $\mathcal{A}$ with respect to the state $\omega_R$. We write $M_R = \{\pi_R(\mathcal{A})\}''$, which is always a factor, most often of type III (see [PS70] Theorem 5.1 and Lemma 5.3).

Let $\{s_t\}_{t \geq 0}$ be the shift semigroup on $\mathcal{H}$. Under the assumption $s^*_t R s_t = R$ for all $t \geq 0$ and by [Arv03] Proposition 13.2.3 and [PS70] Lemma 5.3, there exists an $E_0$-semigroup $\alpha = \{\alpha_t : t \geq 0\}$ on $M_R$ which is known as **CAR flow of rank dim $\mathcal{K}$**.

Under the following conditions, we prove that CAR flows are not extendable on $M_R$ which is always a type $III$ factor under these conditions (see [PS70] Lemma 5.3).

- Both $R$ and $1 - R$ are invertible; i.e., $\exists \epsilon > 0$ such that $\epsilon \leq R \leq 1 - \epsilon$.  
• $R$ is diagonalisable; in fact, there exists an orthonormal basis $\{f_i\}$ for $K$ with
  \[ R f_i = \lambda_i f_i \]
  for some $\lambda_i \in [\epsilon, 1 - \epsilon] \setminus \{\frac{1}{2}\}$.

• $R s_t = s_t R$ $\forall t \geq 0$. (Clearly then, also the Toeplitz condition $s_t^* R s_t = R$ is met.)

At the end of this section we remark that there is an error even in the authors’ claim in [ABS01] that CAR flows arising from quasi-free states given by scalar operators are extendable.

In the last section of this chapter, we prove that our result together with [MS13] will show that CCR flows and CAR flows on type $\text{III}$ factors are not cocycle conjugate.

**Introduction to the chapters**

**Chapter 1:** In the first chapter we rephrase the notion of Hilbert von Neumann modules as spaces of operators between Hilbert space, not unlike [Ske01], but in a seemingly simpler manner and involving far less machinery.

• If $A_2$ is a von Neumann algebra, a Hilbert von Neumann $A_2$-module is a tuple $\mathcal{E} = (E, \mathcal{H}_1, (\pi_2, \mathcal{H}_2))$ where $E$ is a weakly closed subspace of $\mathcal{B}(\mathcal{H}_2, \mathcal{H}_1)$ with $E \supset EE^* E$, equipped with a normal isomorphism $\pi_2 : A_2 \to [E^* E]^2$.

• If $A_1, A_2$ are von Neumann algebras, a Hilbert von Neumann $A_1 - A_2$-bimodule is a tuple $\mathcal{E} = (E, (\pi_1, \mathcal{H}_1), (\pi_2, \mathcal{H}_2))$ comprising a Hilbert von Neumann $A_2$-module $(E, \mathcal{H}_1, (\pi_2, \mathcal{H}_2))$ equipped with a normal unital homomorphism $\pi_1 : A_1 \to [EE^*]$.

We then revisit the proof, in our formulation, of the ‘Riesz lemma’ or what is called ‘self-duality’ in [Ske01] and establish the analogue of the Stinespring dilation theorem for Hilbert von Neumann bimodules.

---

2We shall always use the following notation: if $S \subset \mathcal{H}$ (resp., $S \subset \mathcal{B}(\mathcal{M}, \mathcal{K})$ and $T \subset \mathcal{B}(\mathcal{H}, \mathcal{M})$, then $[S]$ (resp., $[S]$) is the norm- (equivalently weakly (resp., SOT, equivalently WOT)) closed subspace spanned by $S$ (resp., $S$); whereas $S^* T = \{x^* y : x \in S, y \in T\}$.

---
We develop our version of ‘internal tensor products’ (which we refer to as Connes fusion for obvious reasons) in the following way. Suppose $E = (E, (\pi_1, H_1), (\pi_2, H_2))$ is a Hilbert von Neumann $A_1 - A_2$ - bimodule and $F = (F, (\rho_2, K_2), (\rho_3, K_3))$ is a Hilbert von Neumann $A_2 - A_3$ - bimodule. We know that the normal representation $\rho_2$ of $A_2$ is equivalent to a sub-representation of an infinite ampliation of the faithful normal representation $\pi_2$ of $A_2$; thus there exists an $A_2$ - linear isometry $u : K_2 \to H_2 \otimes \ell^2$: i.e., $u^*u = id_{K_2}$ and $u \rho_2(x) = (\pi_2(x) \otimes id_{\ell^2})u \forall x \in A_2$. It follows that $p = uu^* \in (\pi_2(A_2) \otimes id_{\ell^2})'$. Now, set $p = uu^*$ and then there exists a naturally associated projection $q \in P(\pi_1(A_1)')$ (by a sort of push-forward construction). Then, if $x \in E, y \in F$, define $x \odot y$ to be the composite operator

$$K_3 \xrightarrow{x \odot y} q(H_1 \otimes \ell^2) =: K_3 \xrightarrow{u} K_2 \xrightarrow{uu^*} (H_2 \otimes \ell^2) \xrightarrow{x \otimes id_{\ell^2}} q(H_1 \otimes \ell^2),$$

set $E \odot F = \{x \odot y : x \in E, y \in F\}$; and finally define the Connes fusion of $E$ and $F$ to be

$$E \otimes_{A_2} F =: (E \odot F, (q(\pi_1 \otimes id_{\ell^2})|_{\text{ran } q}, q(H_1 \otimes \ell^2)), (\rho_3, K_3)).$$

Then we verify that the Connes fusion of two Hilbert von Neumann bimodules is again a Hilbert von Neumann bimodule.

In the section of examples of this chapter we relate Jones’ basic construction to the Stinespring dilation associated to the conditional expectation onto a finite-index inclusion.

Suppose $(M, \mathcal{H}, J, P)$ is a standard form of $M$ in the sense of [Haa75]. As indicated in [Haa75], there is then a canonical ‘implementing’ unitary representation

$$Aut(M) \ni \theta \mapsto u_\theta \in \mathcal{L}(\mathcal{H})$$

8
satisfying \( u_\theta x u_\theta^* = \theta(x) \forall x \in M \). We have the natural Hilbert von Neumann \( M - M \) bimodule given by

\[
\mathcal{E}_\theta = (Mu_\theta, (id_M, L^2(M)), (id_M, L^2(M))).
\]

Then we prove that

- ‘Connes fusion corresponds to composition’ in this case, in the sense that if \( \theta, \phi \in Aut(M) \), then

\[
\mathcal{E}_\theta \otimes_M \mathcal{E}_\phi \cong \mathcal{E}_{\theta\phi} :
\]

and further, that

- If \( \theta, \phi \in Aut(M) \), then \( \mathcal{E}_\theta \cong \mathcal{E}_\phi \) if and only if \( \theta \) and \( \phi \) are inner conjugate.

**Chapter 2:** In this chapter we study what it means to say that certain endomorphisms of a factor (which we call *equi-modular*) are extendable.

Let \( \phi \) be a faithful normal state on a factor \( M \) and \( J \) be the modular conjugation operator corresponding to the state \( \phi \). Let \( \theta \) be a normal unital *-endomorphism which preserves \( \phi \). The invariance assumption \( \phi \circ \theta = \phi \) implies that there exists a unique isometry \( u_\theta \) on \( L^2(M, \phi) \) such that \( u_\theta x 1_M = \theta(x) 1_M \) and equivalently, that \( u_\theta x = \theta(x) u_\theta \forall x \in M \) and \( u_\theta 1_M = 1_M \). In this chapter we study certain properties of the following endomorphisms.

- If \( M, \phi, \theta \) are as above, and if the associated isometry \( u_\theta \) of \( L^2(M, \phi) \) commutes with the modular conjugation operator \( J \), we shall say \( \theta \) is an **equi-modular** endomorphism of the factorial non-commutative probability space \( (M, \phi) \).

Then we note the following simple consequences of \( \theta \) being an equi-modular endomorphism.

- The equation \( \theta' = j \circ \theta \circ j \) defines a unital normal *-endomorphism of \( M' \)
which preserves $\phi' = \overline{\phi \circ j}$, where $j = J(\cdot)J$ is a $^*$-preserving conjugate-linear isomorphism of $\mathcal{L}(L^2(M, \phi))$ onto itself; and

- We have an identification

$$L^2(M', \phi') = L^2(M, \phi)$$

$$\overline{1_{M'}} = \overline{1_M}$$

$$u_{\varphi'} = u_{\varphi}$$

- there exists a unique endomorphism $\theta^{(2)}$ of $\mathcal{L}(L^2(M, \phi))$ satisfying

$$\theta^{(2)}(x,j(y)) = \theta(x)j(\theta(y))z, \; \forall x, y \in M$$

where $z = \wedge\{p \in (\theta(M) \cup \theta'(M'))'' : \text{ran}(p) \supset \{\theta(x) : x \in M\}\}$. It turns out that equi-modularity of $\theta$ forces $\theta(M)\overline{1_M}$ to be globally invariant under the modular group $\sigma^\phi$ and consequently there exists a faithful normal $\phi$-preserving conditional expectation of $M$ onto $\theta(M)$. Let $P = \theta(M) \subset M \subset P_1$ be the Jones’ basic construction (thus, $P_1 = JP'J$ and the Jones projection is given by $e_{\theta} = u_{\theta}u_{\theta}^*\theta$). Then we prove that the following statements are equivalent for equi-modular endomorphisms.

- there exists a unique unital normal $*$-endomorphism $\theta^{(2)}$ of $\mathcal{L}(L^2(M, \phi))$ such that $\theta^{(2)}(x) = \theta(x)$ and $\theta^{(2)}(j(x)) = j(\theta(x))$ for all $x \in M$.

- $P \vee JPJ$ is a factor; and in this case, it is necessarily a type $I$ factor.

- $(P \vee JPJ)' = P' \cap P_1$ is a factor; and in this case, it is necessarily a type $I$ factor.

- $\{x\hat{y} : x \in P' \cap P_1, y \in P\}$ is total in $L^2(M, \phi)$.

- $M = (M \cap \theta(M)) \vee \theta(M)$. (Note that the right-hand side is naturally identified with the von Neumann algebra tensor product $(M \cap \theta(M)) \otimes \theta(M)$ in this
An endomorphism of a factor which satisfies the equivalent conditions above will be said to be **extendable**. Then we exhibit some examples of extendable endomorphisms on a McDuff factor.

In the next section of this chapter we discuss extendability of $E_0$-semigroups on factors. An $E_0$-semigroup $\alpha = \{\alpha_t : t \geq 0\}$ on a factorial probability space $(M, \phi)$ is said to be extendable if for every $t \geq 0$, $\alpha_t$ is extendable. We show that extendability of an $E_0$-semigroup is cocycle conjugacy invariant. Then we make a note that CCR flows on type $III$ factors arising from some quasi-free states are examples of extendable $E_0$-semigroups while the Clifford flow on the hyperfinite $II_1$ factor is not extendable. We also observe that free flows on free group factors $LF_\infty$ are not extendable.

Alexis Alevras in [Ale04] proved that Clifford flow and CAR flow on the hyperfinite $II_1$ factor are cocycle conjugate. We conclude that the CAR flow on the hyperfinite $II_1$ is not extendable. In the end of this section we point out an error in the authors’ claim in [ABS01] that the Clifford flow is extendable. (They state this in terms of a notion they call regularity which is close to our notion of extendability.)

**Chapter 3:** This chapter is dedicated to studying extendability of CAR flows on type $III$ factors. Let $\mathcal{H} = L^2(0, \infty) \otimes \mathcal{K}$, where $\mathcal{K}$ is any Hilbert space and $\mathcal{A}$ be the CAR algebra over $\mathcal{H}$. Every positive contraction $R$ on $\mathcal{B}(\mathcal{H})$ determines a so-called quasi-free state $\omega_R$ on $\mathcal{A}$. Let $(\pi_R, \mathcal{H}_R, \Omega_R)$ be the GNS triple for the $C^*$-algebra $\mathcal{A}$ with respect to the state $\omega_R$. We write $M_R = \{\pi_R(\mathcal{A})\}''$, which is always a factor, most often of type III (see [PS70] Theorem 5.1 and Lemma 5.3).

Let $\{s_t\}_{t \geq 0}$ be the shift semigroup on $\mathcal{H}$. Under the assumption $s^*_t R s_t = R$ for all $t \geq 0$ and by [Arv03] Proposition 13.2.3 and [PS70] Lemma 5.3, there exists an $E_0$-semigroup $\alpha = \{\alpha_t : t \geq 0\}$ on $M_R$ which is known as **CAR flow of rank dim**
\( \mathcal{K} \).

Under the following conditions, we prove that CAR flows are not extendable on \( M_R \) which is always a type \( III \) factor under these conditions (see [PS70] Lemma 5.3).

- Both \( R \) and \( 1 - R \) are invertible; i.e., \( \exists \epsilon > 0 \) such that \( \epsilon \leq R \leq 1 - \epsilon \).
- \( R \) is diagonalisable; in fact, there exists an orthonormal basis \( \{ f_i \} \) for \( \mathcal{K} \) with \( Rf_i = \lambda_i f_i \) for some \( \lambda_i \in [\epsilon, 1 - \epsilon] \setminus \{ \frac{1}{2} \} \).
- \( Rs_t = s_t R \ \forall t \geq 0 \). (Clearly then, also the Toeplitz condition \( s_t^* R s_t = R \) is met.)

In the end of this section we remark that there is an error even in the authors’ claim in [ABS01] that CAR flows arising from quasi-free states given by scalar operators are extendable.

In the last section of this chapter, we prove that our result together with [MS13] will show that CCR flows and CAR flows on type \( III \) factors are not cocycle conjugate.
Chapter 1

Hilbert von Neumann Modules

This chapter is devoted to study of Hilbert von Neumann modules. The study of Hilbert von Neumann modules are closely related to the study of Hilbert $C^*$-modules. Hilbert $C^*$-module is a module over a $C^*$-algebra with an inner product taking value in that $C^*$-algebra fulfilling certain axioms generalizing those of the inner product of a Hilbert space. The notions of $C^*$-module and von Neumann module have been around for some time now. It is an well established subject (see the monograph [Lan95] for extensive references). Hilbert $C^*$-modules first appeared in the work of Kaplansky [Kap53]. Then Hilbert modules were studied more or less simultaneously by Paschke [Pas73] and Rieffel [Rie74].

In this chapter we introduce a way of regarding Hilbert von Neumann modules as spaces of operators between Hilbert space, not unlike [Ske01], but in an apparently simpler manner and involving far less machinery. We verify that our definition is equivalent to that of [Ske01], by verifying the ‘Riesz lemma’ or what is called ‘self-duality’ in [Ske01]. An advantage with our approach is that we can totally side-step the need to go through $C^*$-modules and avoid the two stages of completion - first in norm, then in the strong operator topology - involved in the former approach.

We establish the analogue of the Stinespring dilation theorem for Hilbert von Neumann bimodules, and we develop our version of ‘internal tensor products’ which we refer
to as Connes fusion for obvious reasons.

In the section of examples, we examine the bimodules arising from automorphisms of von Neumann algebras, verify that fusion of bimodules corresponds to composition of automorphisms in this case, and that the isomorphism class of such a bimodule depends only on the inner conjugacy class of the automorphism. We also relate Jones’ basic construction to the Stinespring dilation associated to the conditional expectation onto a finite-index inclusion (by invoking the uniqueness assertion regarding the latter).

1.1 Preliminaries

The symbols \( \mathcal{H} \) and \( \mathcal{K} \), possibly anointed with subscripts or other decorations, will always denote complex separable Hilbert spaces, while \( \mathcal{L}(\mathcal{H}, \mathcal{K}) \) will denote the set of bounded operators from \( \mathcal{H} \) to \( \mathcal{K} \). For \( E \subset \mathcal{L}(\mathcal{H}, \mathcal{K}) \), we shall write \([E]\) for the closure, in the weak operator topology (WOT, in the sequel), of the linear subspace of \( \mathcal{L}(\mathcal{H}, \mathcal{K}) \) spanned by \( E \). Similarly, if \( S \subset \mathcal{H} \) is a set of vectors, we shall write \([S]\) for the norm-closed subspace of \( \mathcal{H} \) spanned by \( S \).

Without explicitly citing it again to justify statements we make, we shall use the fact that a linear subspace of \( \mathcal{H} \) (resp., \( \mathcal{L}(\mathcal{H}, \mathcal{K}) \)) is closed in the weak topology (resp., WOT) if and only if it is closed in the strong or norm topology (resp., ‘SOT’). (For example, \([E]\) is an algebra if \( E \) is.)

If \( E \subset \mathcal{L}(\mathcal{H}, \mathcal{K}) \) and \( F \subset \mathcal{L}(\mathcal{H}_1, \mathcal{H}) \), we write

\[
EF = \{ xy : x \in E, y \in F \} \quad \text{and} \quad E^* = \{ x^* : x \in E \} .
\]

If \( i : \mathcal{H}_0 \hookrightarrow \mathcal{H} \) and \( j : \mathcal{K}_0 \hookrightarrow \mathcal{K} \), then we shall think of \( \mathcal{L}(\mathcal{H}, \mathcal{K}_0) \) as the subset \( j \mathcal{L}(\mathcal{H}, \mathcal{K}_0)i \) of \( \mathcal{L}(\mathcal{H}_0, \mathcal{K}) \).

**Proposition 1.1.1.** For \( i = 1, 2 \), let \( e_i \) denote the projection of \( \mathcal{H}_1 \oplus \mathcal{H}_2 \) onto \( \mathcal{H}_i \). The following conditions on an \( E \subset \mathcal{L}(\mathcal{H}_2, \mathcal{H}_1) \) are equivalent:
1. There exists a von Neumann algebra $M \subset \mathcal{L}(\mathcal{H}_1 \oplus \mathcal{H}_2)$ such that $e_1, e_2 \in M$ and $E = e_1 M e_2$.

2. $E = [E] \supset EE^* E$.

When these equivalent conditions are met, we shall say that $(E, \mathcal{H}_1, \mathcal{H}_2)$ is a $(1,2)$ von Neumann corner.

**Proof.** (1) $\Rightarrow$ (2) is obvious.

(2) $\Rightarrow$ (1): Observe that the assumption (2) implies that $[E^* E]$ is a WOT-closed $*$-subalgebra of $\mathcal{L}(\mathcal{H}_2)$. Let $p_2 = \sup\{ p : p \in \mathcal{P}([E^* E]) \}$ and define $M_{22} = [E^* E] + \mathbb{C}(e_2 - p_2)$; so $M_{22}$ is a von Neumann subalgebra of $\mathcal{L}(\mathcal{H}_2)$ and $e_2 - p_2$ is a central minimal projection in it.

Similarly, define $M_{11} = [E E^*] + \mathbb{C}(e_1 - p_1)$, where $p_1 = \sup\{ p : p \in \mathcal{P}([E E^*]) \}$; so $M_{11}$ is a von Neumann subalgebra of $\mathcal{L}(\mathcal{H}_1)$ and $e_1 - p_1$ is a central minimal projection in it.

Finally set $M_{12} = E, M_{21} = E^*$ and $M = \sum_{i,j=1}^{2} M_{ij}$. (Alternatively $M$ is the von Neumann algebra $(E \cup E^*)''$; and it is clear that $E = e_1 M e_2$.)

**Definition 1.1.2.**

1. The projection $p_1$ (resp. $p_2$) occurring in the proof of Proposition 1.1.1 will be referred to as the left-support (resp., right-support) projection of the $(1,2)$ von Neumann corner $E$.

2. A $(1,2)$ von Neumann corner $(E, \mathcal{H}_1, \mathcal{H}_2)$ will be said to be non-degenerate if its support projections are as large as they can be: i.e., $p_i = (e_i =) 1_{\mathcal{H}_i}, i = 1, 2$.

**Remark 1.1.3.**

1. The support projections $p_1, p_2$ of $E$ have the following equivalent descriptions:

   - $\text{ran } p_1 = [\bigcup \{ \text{ran } x : x \in E \}] = (\bigcap \{ \text{ker } x^* : x \in E \}^\perp)$; and
   - $\text{ran } p_2 = [\bigcup \{ \text{ran } x^* : x \in E \}] = (\bigcap \{ \text{ker } x : x \in E \}^\perp)$. 

3
2. A $(1,2)$ von Neumann corner $(E, \mathcal{H}_1, \mathcal{H}_2)$ is non-degenerate precisely when $M_{11}(E) = [EE^*]$ and $M_{22}(E) = [E^*E]$ are unital von Neumann subalgebras of $\mathcal{L}(\mathcal{H}_1)$ and $\mathcal{L}(\mathcal{H}_2)$ respectively.

**Definition 1.1.4.** 1. If $A_2$ is a von Neumann algebra, a **Hilbert von Neumann $A_2$-module** is a tuple $\mathcal{E} = (E, \mathcal{H}_1, (\pi_2, \mathcal{H}_2))$ where $(E, \mathcal{H}_1, \mathcal{H}_2)$ is a $(1,2)$ von Neumann corner equipped with a normal isomorphism $\pi_2 : A_2 \to [E^*E]$.

2. A **submodule** of a Hilbert von Neumann $A_2$-module $E$ is a subset $E_1 \subset E$ satisfying

$$E_1 = [E_1] \supset E_1E^*E.$$

3. If $A_1, A_2$ are von Neumann algebras, a **Hilbert von Neumann $A_1-A_2$-bimodule** is a tuple

$$\mathcal{E} = (E, (\pi_1, \mathcal{H}_1), (\pi_2, \mathcal{H}_2))$$

comprising a Hilbert von Neumann $A_2$-module $(E, \mathcal{H}_1, (\pi_2, \mathcal{H}_2))$ equipped with a normal unital homomorphism $\pi_1 : A_1 \to [EE^*]$ (where the 'unital requirement' is that $\pi_1(1_{A_1}) = p_1$ is the identity of $[EE^*]$).

**Remark 1.1.5.** 1. If $E \subset \mathcal{L}(\mathcal{H}_2, \mathcal{H}_1)$ is any (possibly degenerate) $(1,2)$ von Neumann corner, with associated support projections $p_1, p_2$ (as in Definition 1.1.2), define $K_i = \text{ran } p_i, A_1 = [EE^*], A_2 = [E^*E]$ and let $\pi_i$ denote the identity representation of $A_i$ on $K_i$; then $(E, (\pi_1, K_1), (\pi_2, K_2))$ is seen to be a non-degenerate Hilbert von Neumann $A_1-A_2$-bimodule. This is why non-degeneracy is not a serious restriction.

2. A Hilbert von Neumann $A_2$-module $(E, \mathcal{H}_1, (\pi_2, \mathcal{H}_2))$ does indeed admit a right-$A_2$ action and an $A_2$-valued inner product thus:

$$x \cdot a_2 = x\pi_2(a_2) ; \langle x_1, x_2 \rangle_{A_2} = \pi_2^{-1}(x_1^*x_2)$$
(Here and in the sequel, we shall write $\langle \cdot, \cdot \rangle_B$ for the $B$-valued inner-product on a Hilbert $B$-module.) Notice, further, that the norm $E$ acquires from this Hilbert $A_2$-module structure is nothing but the operator norm on $E$.

3. A submodule of a Hilbert von Neumann $A_2$-module is a (possibly degenerate) $(1,2)$ von Neumann corner.

4. In a general Hilbert von Neumann $A_2$-module $\mathcal{E} = (E, \mathcal{H}_1, (\pi_2, \mathcal{H}_2))$, note that

$$[EE^*] \ni a \mapsto (E \ni x \mapsto a \cdot x = : ax)$$

defines a *-homomorphism of $[EE^*]$ into the space $L^a(E)$ of bounded adjointable operators on $E$, since, for instance

$$\langle a \cdot x, y \rangle_{A_2} = (ax)^* y$$

$$= x^* (a^* y)$$

$$= x^* (a^* \cdot y)$$

$$= (x, a^* \cdot y)_{A_2}.$$

5. In the language of (2) above, the ‘rank-one operator’ $\theta_{x,y}$ is seen to be given by

$$\theta_{x,y}(z) = x \langle y, z \rangle_{A_2}$$

$$= xy^* z,$$

so that the ‘rank-one operator’ $\theta_{x,y}$ on $E$ is nothing but left multiplication by $xy^*$ on $E$, for any $x, y \in E$. Let us write $B = [EE^*]$, $C = A_2$ and $A$ for the norm-closure of the linear span of $EE^*$. Then it is clear that $A$ is a norm-closed ideal in $B$, and that there is a unique $C^*$-algebra isomorphism $\alpha : A \to \mathcal{K}(E)$ such that $\alpha(xy^*) = \theta_{x,y}$, $\forall x, y \in E$. If $E$ is non-degenerate, then $A$ is an essential ideal in $B$ and $\alpha$ is injective. It then follows from [Lan] Proposition 2.1, that $\alpha$ extends
uniquely to an isomorphism of $B$ onto $\mathcal{L}^a(E)$. (In fact, the reason for introducing the symbols $A, B, C$ above was in order to use exactly the same symbols as in the Proposition 2.1 referred to above.)

6. This remark concerns our requirement, in the definition of a Hilbert von Neumann $A_2$-module, that $\pi_2 : A_2 \rightarrow [E^*E]$ must be an isomorphism. What is really needed is that $\pi_2$ is onto. If $\pi_2$ is merely surjective but not injective, there must exist a central projection $z \in A_2$ such that $\ker \pi_2 = (1 - z)A_2$ so $\pi_2$ would map $zA_2$ isomorphically onto $[E^*E]$ and the $A_2$-valued inner product (see item (2) of this remark) would actually take values in $zA_2$ and we could apply our analysis to $zA_2$ and think of $A_2$ as acting via its quotient (and ideal) $zA_2$.

7. The ‘unital requirement’ made in the definition of a Hilbert von Neumann bimodule has the consequence that $\pi_1(A_1)E = E$.

**Lemma 1.1.6.** Let $(E, \mathcal{H}_1, \mathcal{H}_2)$ be a $(1,2)$ von Neumann corner. Suppose $x \in \mathcal{L}(\mathcal{H}_2, \mathcal{H}_1)$ has polar decomposition $x = u|x|$. Then the following conditions are equivalent:

1. $x \in E$.
2. $u \in E$ and $|x| \in [E^*E]$.
3. $u \in E$ and $|x^*| \in [EE^*]$.

**Proof.** Since (2) $\Rightarrow$ (1) and (3) $\Rightarrow$ (1) are obvious, let us prove the reverse implications. So, suppose $x \in E$. Then $x^*x \in E^*E$ (resp., $xx^* \in EE^*$) and as, $|t|$ is uniformly approximable on compact subsets of $\mathbb{R}$ by polynomials with vanishing constant term, it is seen that $|x| \in [E^*E]$ and $|x^*| \in [EE^*]$. Define $f_n \in C_0([0, \infty))$ by

$$f_n(t) = \begin{cases} 0 & \text{if } t < \frac{1}{2n} \\ 2n^2(t - \frac{1}{2n}) & \text{if } \frac{1}{2n} \leq t \leq \frac{1}{n} \\ \frac{1}{t} & \text{if } t \geq \frac{1}{n} \end{cases}$$

6
Since \( f_n \) is uniformly approximable on \( sp(|x|) \) by polynomials with vanishing constant term, it is seen that \( f_n(|x|) \in [E^*E] \), and hence \( xf_n(|x|) \in E \). It follows from the definitions that \( |x|f_n(|x|) \) WOT-converges to \( 1_{(0,\infty)}(|x|) = u^*u \). In particular, \( u = u(u^*u) = WOT - \lim u(|x|f_n(|x|)) = WOT - \lim xf_n(|x|) \in [E [E^*E]] \subset E \).

\[ \square \]

**Proposition 1.1.7.** If \( E_1 \) is a submodule of a Hilbert von Neumann \( A_2 \)-module \( E \), and if \( E_1 \neq E \), there exists a non-zero \( y \in E \) such that \( y^*x = 0 \ \forall x \in E_1 \).

**Proof.** As observed in Remark 1.1.5(3), \( E_1 \) is a possibly degenerate \((1,2)\) von Neumann corner in \( \mathcal{L}(\mathcal{H}_2, \mathcal{H}_1) \). Let \( p_1 = \bigvee \{ e : e \in \mathcal{P}([E_1^*E_1]) \} \) and \( q_1 = \bigvee \{ f : f \in \mathcal{P}([E_1^*E_1]) \} \) be the right- and left-support projections of \( E_1 \). Similarly, let \( p = \bigvee \{ e : e \in \mathcal{P}([E^*E]) \} \) and \( q = \bigvee \{ f : f \in \mathcal{P}([E^*E]) \} \) be the right- and left-support projections of \( E \).

First observe that the hypotheses imply that

\[
(E^*E)(E_1^*E_1)(E^*E) = (E_1E^*E)^*(E_1E^*E) \subset E_1^*E_1
\]

and hence that \([E_1^*E_1]\) is a WOT-closed ideal in the von Neumann subalgebra \([E^*E]\) of \( \mathcal{L}(p\mathcal{H}_2) \); consequently \( p_1 = \bigvee \{ e : e \in \mathcal{P}([E_1^*E_1]) \} \) is a central projection in \([E^*E]\) and \([E_1^*E_1] = [E^*E]p_1 \). It follows that if \( x_1 \in E_1 \) has polar decomposition \( x_1 = u_1|x_1| \), then (by Lemma 1.1.6) \( u_1 \in E_1 \) and \( |x_1| \in [E_1^*E_1] = [E^*E]p_1 \), and in particular, \( x_1p_1 = u_1|x_1|p_1 = u_1|x_1| = x_1 \); i.e., \( E_1 = E_1p_1 \).

Next, by definition, \( \bigcup \{ \text{ran } x_1 : x_1 \in E_1 \} = \bigcup \{ \text{ran } x_1x_1^* : x_1 \in E_1 \} = \bigcup \{ \text{ran } 1_{(0,\infty)}(|x_1^*|) : x_1 \in E_1 \} = \text{ran } q_1 \); hence if \( x_1 \in E_1 \), then \( x_1 = q_1x_1 \), and we see that \( E_1 = q_1E_1 \).

Summarising the previous two paragraphs, we have

\[
E_1 = q_1E_1 = E_1p_1 . \tag{1.1.1}
\]

(In fact, \( x_1 = x_1p_1 = q_1x_1 \ \forall \ x_1 \in E_1 \).)

We now consider three cases:
Case 1: \( p_1 \neq p \)

Here \( (p - p_1) \neq 0 \) and the definition of \( p \) implies that there exists a \( y \in E \) such that \( y = y(p - p_1) \neq 0 \). Then, for any \( x \in E_1 \), we have \( x = xp_1 \) and hence

\[
y^*x = (p - p_1)y^*x = (p - p_1)y^*xp_1 \in (p - p_1)E^*Ep_1 = (p - p_1)p_1E^*E = \{0\}.
\]

Case 2: \( q_1 \neq q \)

Here \( (q - q_1) \neq 0 \) and the definition of \( q \) implies that there exists a \( y \in E \) such that \( y = (q - q_1)y \neq 0 \). Then, for any \( x \in E_1 \), we have \( x = q_1x \) and hence

\[
y^*x = y^*(q - q_1)x = y^*(q - q_1)q_1x = 0.
\]

Case 3: \( p_1 = p, q_1 = q \).

We shall show that the hypotheses of this case imply that \( E_1 = E \) and hence cannot arise. To see this, begin by noting that the collection of non-zero partial isometries in \( E_1 \) is non-empty in view of Lemma 1.1.6. (Otherwise \( E_1 = \{0\}, p_1 = q_1 = 0 \) and so \( E = \{0\} = E_1 \).) Hence the family \( \mathcal{F} \) of collections \( \{u_i : i \in I\} \) of partial isometries in \( E_1 \) with pairwise orthogonal ranges, is non-empty. Clearly \( \mathcal{F} \) is partially ordered by inclusion, and it is easy to see that Zorn’s lemma is applicable to \( \mathcal{F} \).

If \( \{u_i : i \in I\} \) is a maximal element of \( \mathcal{F} \), we assert that \( \sum_{i \in I} u_iu_i^* = q \). Indeed, if \( (q - \sum_{i \in I} u_iu_i^*) \neq 0 \), the assumption \( q = q_1 \) will imply the existence of an \( x_1 \in E_1 \) such that \( x_1 = (q - \sum_{i \in I} u_iu_i^*)x_1 \neq 0 \). Then \( x_1 \in [E_1E^*_iE_1] \subset E_1 \) and so if \( x_1 = v_1|x_1| \) is its polar decomposition, then \( v_1 \in E_1 \setminus \{0\} \) and \( \text{ran} \ v_1 = \text{ran} \ x_1^* \) is orthogonal to \( \text{ran} \ u_i \) for each \( i \in I \), thus contradicting the maximality of \( \{u_i : i \in I\} \).

Thus, indeed \( q = \sum_{i \in I} u_iu_i^* \), \( u_i \in E_1 \).
Now, if $x \in E$ is arbitrary, then,

$$x = qx = \sum_{i \in I} u_i u_i^* x \in [E_1E_1^*E] \subset [E_1E^*E] \subset E_1$$

and so $E = E_1$ in this case, and the proof of the Proposition is complete. \qed

Given a submodule $E_1$ of a Hilbert von Neumann module $E$, as above, we shall write $E_1^\perp$ for the set \{ $y \in E : y^*E_1 = \{0\}$ \} and refer to it as the orthogonal complement of $E_1$ in $E$. We now reap the consequences of Proposition 1.1.7 in the following Corollary.

**Corollary 1.1.8.** Let $E_1$ be a submodule of a Hilbert von Neumann $A_2$ - module. Then,

1. $E_1^\perp = (1 - q_1)E$, where $q_1$ is the left support projection of $E_1$.

2. $E_1^{\perp\perp} = q_1 E$.

3. If $S$ is any subset of $E$, then $S^{\perp\perp} = [S[E^*E]]$.

4. If $E_1$ is a submodule of a Hilbert von Neumann module $E$, there exists a projection $q_1 \in [EE^*]$ such that $E_1 = E_1^{\perp\perp} = q_1 E$ and $E_1^\perp = (1 - q_1) E$; and in particular $E_1$ is complemented in the sense that $E = E_1 \oplus E_1^\perp$.

**Proof.** It is clear that $y^*x = 0$ if and only if $y$ and $x$ have mutually orthogonal ranges.

(1) The previous sentence and the definition of $q_1$ imply that

$$y \in E_1^\perp \iff (q_1 y = 0 \text{ and } y \in E) \iff y \in (1 - q_1)E.$$ 

(2) follows from (1) and the definition of the orthogonal complement.
(3) Let $E_1 = [SE^*E]$. It should be clear that $y \in S^\perp \Leftrightarrow y \in E_1^\perp = q_1 E$, by part (1) of this Corollary, and hence that

$$S^{\perp \perp} = E_1^{\perp \perp}.$$  

In view of Remark 1.1.5(1) we may view $S^{\perp \perp}$ as a Hilbert von Neumann bimodule, and regard $E_1$ as a submodule of $S^{\perp \perp}$. We may then deduce from Proposition 1.1.7 that if $E_1$ were not equal to $S^{\perp \perp}$, then there would have to exist a non-zero $y \in S^{\perp \perp}$ such that $y^*E_1 = \{0\}$. This would imply that $y \in S^\perp$ and $y \in S^{\perp \perp}$ so that $y^*y = 0$, a contradiction.

(4) follows from the preceding parts of this Corollary. \hfill \square

That our definitions of Hilbert von Neumann modules and bimodules are consistent with those of [Skei] is a consequence of the following version of Riesz’ Lemma, which establishes that our Hilbert von Neumann modules are indeed ‘self-dual’ which is one of the equivalent conditions for a von Neumann module in the sense of [Skei].

On the other hand, it is clear from [Skei] that any Hilbert von Neumann $A_2$ - module in the sense of [Skei] is also a Hilbert von Neumann $A_2$ - module in our sense, and the two formulations are thus equivalent.

**Proposition 1.1.9. (Riesz lemma)** Suppose $E$ is a Hilbert von Neumann $A_2$ - module, and $f : E \to A_2$ is right $A_2$-linear - meaning $f(x\pi_2(a_2)) = \pi_2^{-1}(f(x)\pi_2(a_2))$ for all $x \in E, a_2 \in A_2$, or equivalently and less clumsily, suppose $f : E \to [E^*E]$ is linear and satisfies $f(xz) = f(x)z$ for all $x \in E$, $z \in [E^*E]$; and suppose $f$ is bounded - meaning $\|f(x)\| \leq K\|x\|$ for all $x \in E$, and some $K > 0$. Then there exists $y \in E$ such that $f(x) = y^*x \ \forall x \in E$.

**Proof.** First notice that if $x \in E$ has polar decomposition $x = u|x|$ (so $u \in E, |x| \in$
\[ [E^*E] = \pi_2(\mathcal{A}_2), \text{ and if } \xi \in \mathcal{H}_2, \text{ then} \]

\[
\|f(x)\xi\| = \|f(u)x|\xi\| \quad \text{(by right } \mathcal{A}_2 - \text{ linearity of } f) \\
\leq \|f(u)\|\|x|\xi\| \\
\leq K\|x|\xi\| \\
= K\|u^*x\xi\| \\
\leq K\|x\xi\|. \tag{1.1.2}
\]

Next, find vectors \(\xi_n \in \mathcal{H}_2\) such that \(\mathcal{H}_2 = \bigoplus_n \pi_2(\mathcal{A}_2)\xi_n\) (orthogonal direct sum). It follows that \(p_1\mathcal{H}_1 = \bigoplus_n [E\xi_n]\), where \(p_1\) is the left-support projection of \(E\), because if \(n \neq m\) and \(x, y \in E\), then

\[
\langle x\xi_n, y\xi_m \rangle = \langle \xi_n, x^*y\xi_m \rangle = 0
\]

and

\[
\bigcup_n [E\xi_n] = \bigcup_n [E^*E\xi_n] = [E\mathcal{H}_2] = p_1\mathcal{H}_1.
\]

Infer from the above paragraph and equation 1.1.2 that for arbitrary \(a_n \in \mathcal{A}_2\) with \(\sum_n \|\pi_2(a_n)\xi_n\|^2 < \infty\) and \(x \in E\), we have

\[
\|f(x)(\sum_n \pi_2(a_n)\xi_n)\|^2 = \| \sum_n (f(x)\pi_2(a_n))\xi_n \|^2 \\
= \| \sum_n f(x\pi_2(a_n))\xi_n \|^2 \\
\leq \sum_n K^2\|x\pi_2(a_n)\xi_n\|^2 \quad \text{(by eq. (1.1.2))} \\
= K^2\|x(\sum_n \pi_2(a_n)\xi_n)^2 \; ;
\]

Now deduce that there exists a unique bounded operator \(z_f \in \mathcal{L}(\mathcal{H}_1, \mathcal{H}_2)\) satisfying \(z_f = z_fp_1\) and

\[
z_f(x\xi) = f(x)\xi, \forall x \in E, \xi \in \mathcal{H}_2.
\]

11
The definition of $z_f$ implies that $z_f E \subset [E^* E]$; hence

$$z_f = z_f p_1 \in z_f [EE^*] \subset [z_f E E^*] \subset [(E^* E) E^*] = E^*.$$ 

So $y =: z_f^* \in E$ and we have

$$f(x) = z_f x = y^* x$$

as desired. \qed

1.2 Standard bimodules and complete positivity

Given an element $x$ of a von Neumann algebra $M$, let us write $pr(x)$ for the projection onto the range of $x$. (Thus $pr(x) = 1_{(0, \infty)}(xx^*)$.)

**Lemma 1.2.1.** Suppose $\eta : A \to B$ is a normal positive linear map of von Neumann algebras. Let $e_\eta = \vee \{ u \; pr(\eta(1)) \; u^* : u \in \mathcal{U}(B) \}$ be the $(B)$-central support of $pr(\eta(1))$. Then the smallest WOT-closed ideal in $B$ which contains $\eta(A)$ (equivalently $\eta(1)$) is $e_\eta B$.

(In particular, $\eta(a) = e_\eta \eta(a) \; \forall a \in A$.)

**Proof.** If $p \in \mathcal{P}(A)$, then $\eta(p) \leq \eta(1) \Rightarrow pr(\eta(p)) \leq pr(\eta(1)) \leq e_\eta$. Hence $\eta(p) = e_\eta \eta(p) \in e_\eta B$, so also $B\eta(\eta(A))B \subseteq e_\eta B$. Conclude that $[B\eta(\eta(A))B] = [B\eta(\mathcal{P}(A))B] = [B\eta(\mathcal{P}(A))B] \subseteq e_\eta B$. Conversely, $[B\eta(\eta(A))B] \supset [B\mathcal{U}(B)\eta(\eta(1))\mathcal{U}(B)B] \supset [Be_\eta B] = e_\eta B$, and the proof is complete. \qed

**Definition 1.2.2.** A Hilbert von Neumann $A_2$ - module $E = (E, \mathcal{H}_1, (\pi_2, \mathcal{H}_2))$ will be called **standard** if:

- $\mathcal{H}_2 = L^2(A_2, \phi)$ for some faithful normal state $\phi$ on $A_2$;

- $\pi_2$ is the left-regular representation; and

- $E$ is non-degenerate.
A Hilbert von Neumann $A_1 - A_2$-bimodule will be called standard if it is standard as a Hilbert von Neumann $A_2$-module.

**Theorem 1.2.3.** If $\eta : A_1 \to A_2$ is a normal completely positive map, there exists a standard Hilbert von Neumann $A_1 - e_\eta A_2$ bimodule $E_\eta$, with $e_\eta$ as in Lemma 1.2.1, which is singly generated, (i.e., $E = [\pi_1(A_1)V\pi_2(e_\eta A_2)]$) with a generator $V \in E$ satisfying $V^*\pi_1(a_1)V = \pi_2 \circ \eta(a_1)$.

Further, such a pair $(E, V)$ of a standard bimodule and generator is unique in the sense that if $(\tilde{E}, \tilde{V})$ is another such pair, then there exists $A_i$-linear unitary operators $U_i : H_i(\eta) \to \tilde{H}_i$, $i = 1, 2$ such that $\tilde{V} = U_1V^*U_2$ and $\tilde{E} = U_1E U_2^*$.

**Proof.** Fix a faithful normal state $\phi$ on $e_\eta A_2$ and set $H_2(\eta) = L^2(e_\eta A_2, \phi)$, with $\pi_2$ being the left-regular representation of $e_\eta A_2$. We employ the standard notation $\hat{a} = \pi(a)\hat{1}$ where $\hat{1}$ is the canonical cyclic vector for $\pi(A)$ in $L^2(A)$. The Hilbert space $H_1(\eta)$ is obtained after separation and completion of the algebraic tensor product $A_1 \otimes e_\eta A_2$ with respect to the semi-inner product given by $\langle a_1 \otimes a_2, b_1 \otimes b_2 \rangle = \phi(b_2^*\eta(b_1^*a_1)a_2)$; and $\pi_1 : A_1 \to \mathcal{L}(H_1(\eta))$ is defined by $\pi_1(a_1)(b_1 \otimes b_2) = a_1b_1 \otimes b_2$. The verification that $\pi_1$ is a normal representation is a fairly routine application of normality of $\eta$ and $\phi$.

Define $V : H_2(\eta) \to H_1(\eta)$ to be the unique bounded operator for which $V(e_\eta \hat{a}_2) = 1 \otimes e_\eta a_2$. For arbitrary $a_1 \in A_1, a_2, b_2 \in e_\eta A_2$, note that

$$\langle V^*\pi_1(a_1)V\hat{a}_2, \hat{b}_2 \rangle = \langle a_1 \otimes a_2, 1 \otimes b_2 \rangle$$

$$= \phi(b_2^*\eta(a_1)a_2)$$

$$= \langle \pi_2(\eta(a_1))\hat{a}_2, \hat{b}_2 \rangle$$

thus showing that indeed $V^*\pi_1(a_1)V = \pi_2(\eta(a_1))$ for all $a_1 \in A_1$.

Set $E = [\pi_1(A_1)V\pi_2(e_\eta A_2)]$ and observe that
\[ [E^*E] = [\pi_2(e_\eta A_2)V^*\pi_1(A_1)\pi_1(A_1)V\pi_2(e_\eta A_2)] \]
\[ = [\pi_2(e_\eta A_2)\pi_2(\eta(A_1))\pi_2(e_\eta A_2)] \]
\[ = [\pi_2(e_\eta A_2\eta(A_1)e_\eta A_2)] \]
\[ = \pi_2(e_\eta A_2) \]

by Lemma 1.2.1. Further, if \( x = \pi_1(a_1)V\pi_2(e_\eta a_2) \) for \( a_i \in A_i \), note that, by definition, we have \( x(\hat{\eta}_\eta) = a_1 \otimes e_\eta a_2 \) and hence, \( \bigcup \{ \text{ran } x : x \in E \} = \mathcal{H}_1(\eta) \). This shows that there exist projections \( \{ p_i : i \in I \} \subset [EE^*] \) such that \( id_{\mathcal{H}_1(\eta)} = WOT - \lim_i p_i \). Hence, we see that

\[ \pi_1(A_1) \subset \bigcup \{ \pi_1(A_1)p_i : i \in I \} \subset [\pi_1(A_1)EE^*] \subset [EE^*] \]

and we have verified everything need to see that the tuple \( \mathcal{E}_\eta = (E, (\pi_1, \mathcal{H}_1(\eta)), (\pi_2, \mathcal{H}_2(\eta))) \) defines a standard Hilbert von Neumann \( A_1 - e_\eta A_2 \) - bimodule. As for the uniqueness assertion, if \((\tilde{E}, \tilde{V})\) also works, then \( \tilde{\mathcal{H}}_2 = L^2(e_\eta A_2, \tilde{\phi}) \) for some faithful normal state \( \tilde{\phi} \) on \( e_\eta A_2 \). In view of the ‘uniqueness of the standard module of a von Neumann algebra’ - see [Haa], for instance - there exists an \( e_\eta A_2 \) - linear unitary operator \( U_2 : \mathcal{H}_2(\eta) \to \tilde{\mathcal{H}}_2 \).

Observe next that if \( \xi, \zeta \in \mathcal{H}_2 \) and \( a_1, b_1 \in A_1, a_2, b_2 \in e_\eta A_2 \), then

\[ \langle \pi_1(a_1)V\pi_2(a_2)\xi, \pi_1(b_1)V\pi_2(b_2)\zeta \rangle \]
\[ = \langle \pi_2(b_2^*)V^*\pi_1(b_1^* a_1)V\pi_2(a_2)\xi, \zeta \rangle \]
\[ = \langle \pi_2(b_2^*)\pi_2(\eta(b_1^* a_1))\pi_2(a_2)\xi, \zeta \rangle \]
\[ = \langle \pi_2(b_2^* \eta(b_1^* a_1) a_2)\xi, \zeta \rangle \]
\[ = \langle U_2 \pi_2(b_2^* \eta(b_1^* a_1) a_2)\xi, U_2\zeta \rangle \]
\[ = \langle \tilde{\pi}_2(b_2^* \eta(b_1^* a_1) a_2)\xi, U_2\zeta \rangle \]
\[ = \langle \tilde{\pi}_2(b_2^*)\tilde{\pi}_1(b_1^* a_1)\tilde{V}\pi_2(a_2)U_2\xi, U_2\zeta \rangle \]
\[ = \langle \tilde{\pi}_1(a_1)\tilde{V}\pi_2(a_2)U_2\xi, \tilde{\pi}_1(b_1)\tilde{V}\pi_2(b_2)U_2\zeta \rangle \].
Deduce from the above equation and the assumed non-degeneracy of $E$ and $\tilde{E}$ that there is a unique unitary operator $U_1 : \mathcal{H}_1 \to \tilde{\mathcal{H}}_1$ such that

$$U_1 (\pi_1(a_1) V \pi_2(a_2) \xi) = \tilde{\pi}_1(a_1) \tilde{V} \tilde{\pi}_2(a_2) U_2 \xi$$

(1.2.1)

for all $a_1 \in A_1, a_2 \in e_{\eta}A_2$ and $\xi \in \mathcal{H}_2(\eta)$ It is easy to see from equation (1.2.1) that $U_1$ is necessarily $A_1$ - linear, that $U_1 V = \tilde{V} U_2$ or $\tilde{V} = U_1 V U_2^*$ and that $\tilde{E} = U_1 E U_2^*$, and the proof of the theorem is complete. □

**Remark 1.2.4.** Notice that the irritating $e_{\eta}$ above is equal to the 1 of $A_2$ in some good cases, such as the following:

- when $\eta$ is unital, i.e., $\eta(1) = 1$;
- when $\eta(1) \neq 0$ and $A_2$ is a factor.

The uniqueness assertion in Theorem 1.2.3 can also be deduced from the following useful criterion for isomorphism of standard bimodules:

**Lemma 1.2.5.** Two standard Hilbert von Neumann $A_2$ bimodules $E^{(i)} = (E^{(i)}_1, (\pi^{(i)}_1, \mathcal{H}_1^{(i)}), (\pi^{(i)}_2, \mathcal{H}_2^{(i)})), i = 1, 2$ are isomorphic if and only if there exist $E^{(i)}_0 = \{x^{(i)}_j : j \in I\} \subset E^{(i)}$ such that

1. $[E^{(i)}_0] = E^{(i)}$, and
2. $(\pi^{(1)}_2)^{-1}(x^{(1)*}_j x^{(1)}_k) = (\pi^{(2)}_2)^{-1}(x^{(2)*}_j x^{(2)}_k) \forall j, k \in I$

**Proof.** The only if implication is clear, as we may choose $E^{(i)}_0 = E^{(i)}$ and $x^{(2)} = U_1 x^{(1)} U_2^*$ for all $x^{(1)} \in E^{(1)} (= I)$. Now for the other ‘if half’.

In view of the ‘uniqueness of the standard module of a von Neumann algebra - see [Haa] -there exists an $A_2$ - linear unitary operator $U_2 : \mathcal{H}_2^{(1)} \to \mathcal{H}_2^{(2)}$. For arbitrary
For $j, k \in I, \xi_1, \xi_2 \in \mathcal{H}_2^{(1)}$, observe that

$$
\langle x_j^{(1)} \xi_1, x_k^{(1)} \xi_2 \rangle = \langle \xi_1, x_j^{(1)*} x_k^{(1)} \xi_2 \rangle = \langle U_2 \xi_1, U_2 \pi_2^{(1)} (\pi_2^{(1)})^{-1} (x_j^{(1)*} x_k^{(1)}) \xi_2 \rangle = \langle U_2 \xi_1, \pi_2^{(2)} (\pi_2^{(1)})^{-1} (x_j^{(1)*} x_k^{(1)}) U_2 \xi_2 \rangle = \langle U_2 \xi_1, \pi_2^{(2)} (\pi_2^{(1)})^{-1} (x_j^{(2)*} x_k^{(2)}) U_2 \xi_2 \rangle = \langle x_j^{(2)} U_2 \xi_1, x_k^{(2)} U_2 \xi_2 \rangle ;
$$

deduce from the above equation and the non-degeneracy of the $E^{(i)}$ that there exists a unique unitary operator $U_1 : \mathcal{H}_1^{(1)} \to \widetilde{\mathcal{H}}_1^{(2)}$ such that $U_1(x_j^{(1)} \xi) = x_j^{(2)} U_2 \xi \; \forall \; j \in I, \xi \in \mathcal{H}_2^{(1)}$. The definitions show that $U_1 x_j^{(1)} = x_j^{(2)} U_2 \; \forall \; j \in I$ and hence that $U_1 E^{(1)} = E^{(2)} U_2$. Thus indeed $E^{(2)} = U_1 E^{(1)} U_2^*$ and the proof of the ‘if half’ is complete.

Notice, incidentally, that in the setting of the Lemma above, the equation

$$
T x^{(1)} = U_1 x^{(1)} U_2^*
$$

defines a WOT-continuous linear bijection $T : E^{(1)} \to E^{(2)}$ satisfying

$$
T x^{(1)} (T y^{(1)})^* T z^{(1)} = T (x^{(1)} (y^{(1)})^* z^{(1)})
$$

for all $x^{(1)} y^{(1)}, z^{(1)} \in E^{(1)}$.

**Remark 1.2.6.** 1. The ‘generator’ $V$ of Theorem 1.2.3 is an isometry precisely when $\eta$ is unital.

2. If $E$ is a singly generated Hilbert von Neumann $A_1 - A_2$ bimodule, then it is generated by a partial isometry (by Lemma 1.1.6). Further, that generator, say $V$ may be used
to define the obviously completely positive map $\eta; A_1 \to A_2$ by

$$\eta(a_1) = \pi_2^{-1}(V^*\pi_1(a_1)V);$$

and then $\mathcal{E}$ would be isomorphic to $\mathcal{E}_\eta$ if and only if $\mathcal{E}$ is a standard non-degenerate bimodule.

### 1.3 Connes fusion

**Example 1.3.1.** If $\mathcal{E} = (E, (\pi_1, \mathcal{H}_1), (\pi_2, \mathcal{H}_2))$ is a Hilbert von Neumann $A_1 - A_2$-bimodule and $\mathcal{K}$ is any Hilbert space, then $\mathcal{E} \otimes id_\mathcal{K} = (E \otimes id_\mathcal{K}, (\pi_1 \otimes id_\mathcal{K}, \mathcal{H}_1 \otimes \mathcal{K}), (\pi_2 \otimes id_\mathcal{K}, \mathcal{H}_2 \otimes \mathcal{K}))$ is also a Hilbert von Neumann $A_1 - A_2$-bimodule, where of course we write $E \otimes id_\mathcal{K}$ for $\{x \otimes id_\mathcal{K} : x \in E\}$.

**Lemma 1.3.2.** Let $\mathcal{E} = (E, (\pi_1, \mathcal{H}_1), (\pi_2, \mathcal{H}_2))$ be a Hilbert von Neumann $A_1 - A_2$-bimodule. For a projection $p \in \mathcal{P}(\pi_2(A_2)')$, let $q$ be the projection with range $\bigcup\{\text{ran}(xp) : x \in E\}$. Then

1. $q \in \mathcal{P}(\pi_1(A_1)')$;
2. $y \in E \Rightarrow qyp = qy = yp$; and
3. $q\mathcal{E}p = (qEp, (q\pi_1(\cdot), q\mathcal{H}_1), (p\pi_2(\cdot), p\mathcal{H}_2))$ satisfies all the requirements for a non-degenerate Hilbert von Neumann $A_1 - A_2$-bimodule, with the possible exception of injectivity of $p\pi_2(\cdot)$.

We shall use the suggestive notation $\mathcal{E},p = q$ when $q, \mathcal{E}, p$ are so related.

**Proof.** 1. Since $\pi_1(A_1)E \subset E$, it follows that $\text{ran}(q)$ is stable under $\pi_1(A_1)$.

2. For all $y \in E$, $\text{ran}(yp) \subset \text{ran}(q) \Rightarrow qyp = yp$. Next, if $\xi, \zeta \in \mathcal{H}_2$, and $x, y \in E$,
note that

$$\langle xp\xi, y(1-p)\zeta\rangle = \langle \xi, px^*y(1-p)\zeta \rangle \in \langle \xi, p[E^*E](1-p)\zeta \rangle = 0 ,$$

since $[E^*E] = \pi_2(A_2) \subset \{p\}'$; since $\{xp\xi : \xi \in H_2\}$ is total in $\text{ran}(q)$, this says that $qy(1-p) = 0$, as desired.

3. 

$$[(qEp)^*(qEp)] = [(Ep)^*(Ep)] = p[E^*E]p = p\pi_2(A_2) \quad (1.3.1)$$

since $[E^*E] = \pi_2(A) \subset \{p\}'$; while

$$[(qEp)(qEp)^*] = q[EE^*]q \supset q\pi_1(A_1) . \quad (1.3.2)$$

Non-degeneracy of $qEp$ follows immediately from equations (1.3.1) and (1.3.2). \hfill \Box

**Remark 1.3.3.** In general, if $\pi : M \to \mathcal{L}(H)$ is a faithful normal representation, and if $p \in \pi(M)'$, the sub-representation $p\pi(\cdot)$ is faithful if and only if the central support of $p$ is 1 - i.e., sup$\{upu^* : u \in \pi(M)\}' = 1$.

In particular if the $E$ of Lemma 1.3.2 is actually a Hilbert von Neumann $A_1 - A_2$ - bimodule, and if $A_2$ happens to be a factor, then the $qEp$ of Lemma 1.3.2 is actually a Hilbert von Neumann bimodule.

We next lead to our description of what is sometimes termed ‘internal tensor product’ but which we prefer (in view of this terminology being already in use for tensor products of bimodules over von Neumann algebras) to refer to as the *Connes fusion* of Hilbert von Neumann bimodules. Thus, suppose $E = (E, (\pi_1, H_1), (\pi_2, H_2))$ is a Hilbert von Neumann $A_1 - A_2$ - bimodule and $F = (F, (\rho_2, K_2), (\rho_3, K_3))$ is a Hilbert von Neumann $A_2 - A_3$ - bimodule. We know that the normal representation $\rho_2$ of $A_2$ is equivalent to a sub-representation of an infinite ampliation of the faithful normal representation $\pi_2$ of

18
A_2; thus there exists an $A_2$-linear isometry $u : K_2 \to H_2 \otimes \ell^2$: i.e., $u^*u = id_{K_2}$ and $up_2(x) = (\pi_2(x) \otimes id_{\ell^2})u \forall x \in A_2$. It follows that $p = uu^* \in (\pi_2(A_2) \otimes id_{\ell^2})'$.

Now, set $p = uu^*$ and let $q = (\mathcal{E} \otimes 1_{\ell^2})_*(p)$ be associated to this $p$ as in Lemma 1.3.2 (applied to $\mathcal{E} \otimes 1_{\ell^2}$).

Finally, if $x \in E, y \in F$, define $x \bigodot y$ to be the composite operator

$$K_3 \xrightarrow{\pi_2 \otimes id_{\ell^2}} q(\mathcal{H}_1 \otimes \ell^2) = K_3 \xrightarrow{u} K_2 \xrightarrow{uu^*(\mathcal{H}_2 \otimes \ell^2)} x \otimes id_{\ell^2} \xrightarrow{y} q(\mathcal{H}_1 \otimes \ell^2),$$

set $E \odot F = \{x \bigodot y : x \in E, y \in F\}$; and finally define the Connes fusion of $\mathcal{E}$ and $\mathcal{F}$ to be

$$\mathcal{E} \otimes_{A_2} \mathcal{F} = (E \bigodot F, q(\pi_1 \otimes id_{\ell^2})|_{ran q}, q(\mathcal{H}_1 \otimes \ell^2)), ( \rho_3, \mathcal{K}_3)).$$

The justification for our use of ‘Connes fusion’ for our construction lies (at least for standard bimodules, by Lemma 1.2.5) in the fact that (in the notation defining Connes fusion) the $A_3$-valued inner product on $\mathcal{E} \odot \mathcal{F}$ satisfies

$$\langle x_1 \bigodot y_1, x_2 \bigodot y_2 \rangle_{A_3} = (x_1 \bigodot y_1)^*(x_2 \bigodot y_2)$$

$$= ((x_1 \otimes id_{\ell^2})uy_1)^*(x_2 \otimes id_{\ell^2})uy_2$$

$$= y_1^* (x_1^*x_2 \otimes id_{\ell^2})uy_2$$

$$= y_1^* (x_1^*x_2)y_2 \quad \text{(since } u \text{ is an } A_2 \text{-linear isometry})$$

$$= y_1^* \langle x_1, x_2 \rangle_{A_2} y_2$$

$$= \langle y_1, \langle x_1, x_2 \rangle_{A_2} y_2 \rangle_{A_3}.$$  

**Proposition 1.3.4.** The Connes fusion of (non-degenerate) Hilbert von Neumann bimodules is again a (non-degenerate) Hilbert von Neumann bimodule.

**Proof.** Clearly $E \bigodot F$ is a WOT-closed linear space of operators between the asserted spaces. Observe next that
\[
\begin{align*}
\left((E \otimes F)(E \otimes F)^*\right) &= \left\{((x_1 \otimes id_\ell_2)u y_1)((x_2 \otimes id_\ell_2)u y_2)^* : x_i \in E, y_j \in F\right\} \\
&= \left\{((x_1 \otimes id_\ell_2)u y_1) y_2^* u^*(x_2 \otimes id_\ell_2)^* : x_i \in E, y_j \in F\right\} \\
&= \left\{((x_1 \otimes id_\ell_2)u [FF^*] u^*(x_2 \otimes id_\ell_2)^* : x_i \in E\right\} \\
&\supset \left\{((x_1 \otimes id_\ell_2)u p_2(A_2)u^*(x_2 \otimes id_\ell_2)^* : x_i \in E\right\} \\
&= \left\{((x_1 \otimes id_\ell_2)(\pi_2(A_2) \otimes id_\ell_2)u u^*(x_2 \otimes id_\ell_2)^* : x_i \in E\right\} \\
&= \left\{((E \otimes id_\ell_2)u u^*(E \otimes id_\ell_2)^*\right\} \quad \text{(since } E\pi_2(A_2) = E) \\
&= q(\pi_1(A_1) \otimes id_\ell_2)
\end{align*}
\]

(in particular \(q \in [(E \otimes F)(E \otimes F)^*]\)) and that

\[
\begin{align*}
\left((E \otimes F)^*(E \otimes F)\right) &= \left\{((x_1 \otimes id_\ell_2)u y_1)^*(x_2 \otimes id_\ell_2)u y_2) : x_i \in E, y_j \in F\right\} \\
&= \left\{((y_1^* u^*(x_1^* x_2 \otimes id_\ell_2))u y_2) : x_i \in E, y_j \in F\right\} \\
&= \left\{((y_1^* u^*(\pi_2(A_2) \otimes id_\ell_2)u y_2) : y_j \in F\right\} \\
&= \left\{((y_1^* u^*[\rho_2(A_2)] y_2) : y_j \in F\right\} \\
&= \left\{((y_1^* (\rho_2(A_2)) y_2) : y_j \in F\right\} \\
&= F^* F \quad (* \\
&= \rho_3(A_3) ,
\end{align*}
\]

where the justification for the step labelled (*) is that \(\rho_2(A_2)F = F\) (see Remark 1.1.5 (7)). This completes the verification that \(E \otimes_{A_2} F\) is indeed a Hilbert von Neumann \(A_1 - A_3\) bimodule.
Now, suppose $E$ and $F$ are both non-degenerate. Then

$$\xi \in \bigcap \{\ker z : z \text{ in } E \odot F\}$$

$$\Rightarrow (x \otimes \text{id}_E)uy\xi = 0 \ \forall x \in E, y \in F$$

$$\Rightarrow uy\xi = 0 \ \forall y \in F \quad \text{(as } E \otimes \text{id}_E \text{ is non-degenerate)}$$

$$\Rightarrow y\xi = 0 \ \forall y \in F \quad \text{(as } u \text{ is isometric)}$$

$$\Rightarrow \xi = 0 \quad \text{(as } F \text{ is non-degenerate)}$$

while

$$\bigcup \{\text{ran}((x \otimes \text{id}_E)uy) : x \in E, y \in F\}$$

$$= \bigcup \{\text{ran}((x \otimes \text{id}_E)u) : x \in E\} \quad \text{(since } F \text{ is non-degenerate)}$$

$$= \bigcup \{\text{ran}((x \otimes \text{id}_E)uu^*) : x \in E\}$$

$$= \text{ran } q \quad \text{(by definition)}$$

and hence $E \odot F$ is indeed non-degenerate.

Before addressing the question of the dependence of the definition of Connes fusion and the seemingly ad hoc $A_2$ - linear partial isometry $u$, we introduce a necessary definition and the ubiquitous lemma.

**Definition 1.3.5.** Two Hilbert von Neumann $A_2$ modules, say $E^{(i)} = (E^{(i)}_1, \mathcal{H}^{(i)}_1, (\pi^{(i)}_1, \mathcal{H}^{(i)}_2)), i = 1, 2$ are considered isomorphic if there exists unitary operators $w_j : \mathcal{H}^{(1)}_j \rightarrow \mathcal{H}^{(2)}_j$, with $w_2$ being $A_2$ - linear, such that

$$E^{(2)} = w_1 E^{(1)} w_2^* .$$

If the $E^{(i)}$ happen to be $A_1 - A_2$ bimodules, they are said to be isomorphic if, in addition to the above, the unitary $w_1$ happens to be $A_1$ - linear.
Lemma 1.3.6. Let $\mathcal{E} = (E, (\pi_1, \mathcal{H}_1), (\pi_2, \mathcal{H}_2))$ be a Hilbert von Neumann $A_1 - A_2$ bimodule. Suppose $w \in \pi_2(A_2)'$ is a partial isometry with $w^*w = p, ww^* = \tilde{p}$. Let $q = \mathcal{E}p$ and $\tilde{q} = \mathcal{E}\tilde{p}$ in the notation of Lemma 1.3.2. Then there exists a unique partial isometry $w_1 \in \pi_1(A_1)'$ such that $w_1^*w_1 = q, w_1w_1^* = \tilde{q}$.

Proof. We first assert that there is a unique unitary operator $W_1 : q(\mathcal{H}_1) \to \tilde{q}(\mathcal{H}_1)$ satisfying $WTp = Tw \ \forall T \in E$. This is because:

- $(T_1w)^*(T_2w) = w^*T_1^*T_2w = T_1^*T_2p = p^*T_1^*T_2p, \ \forall T_1, T_2 \in E$ and
- $q(\mathcal{H}_1) = \bigcup \{\text{ran}(Tp) : T \in E\}$ and $\tilde{q}(\mathcal{H}_1) = \bigcup \{\text{ran}(Tw) : T \in E\}$ (since $\text{ran} w = \text{ran} \tilde{p}$).

Finally $w_1 = W_1q$ does the job. \hfill $\square$

Remark 1.3.7. 1. We now verify that the definition we gave of $\mathcal{E} \otimes_{A_2} \mathcal{F}$ is really independent of the choice of the isometry $u$ used in that definition. Indeed, suppose $u, \tilde{u} : K_2 \to \mathcal{H}_2 \otimes \ell^2$ are two $A_2$-linear isometries. If $uw^* = p, \tilde{u}u^* = \tilde{p}$, then $w = \tilde{u}u^*$ is a partial isometry in $(\pi_2(A_2) \otimes id_{\ell^2})'$ with $w^*w = p, ww^* = \tilde{p}$. Now apply Lemma 1.3.6 to $\mathcal{E} \otimes id_{\ell^2}$ and $w, p, \tilde{p}$ to find a $W \in (\pi_1(A_1) \otimes id_{\ell^2})'$ such that $W^*W = q = (\mathcal{E} \otimes id_{\ell^2})p$ and $WW^* = \tilde{q} = (\mathcal{E} \otimes id_{\ell^2})\tilde{p}$. Then, as the proof of Lemma 1.3.6 shows, $W : q(\mathcal{H}_1 \otimes \ell^2) \to \tilde{q}(\mathcal{H}_1 \otimes \ell^2)$ is a unitary operator satisfying $W(x \otimes id_{\ell^2}) p = (x \otimes id_{\ell^2})w \ \forall x \in E$. It is now a routine matter to verify that the unitary operators $W : q(\mathcal{H}_1 \otimes \ell^2) \to \tilde{q}(\mathcal{H}_1 \otimes \ell^2)$ and $id_{K_3}$ establish an isomorphism between the models of $\mathcal{E} \otimes_{A_2} \mathcal{F}$ given by $u$ and $\tilde{u}$ are isomorphic.

2. A not dissimilar reasoning shows that the isomorphism type of the Connes fusion of two standard bimodules depends only on the isomorphism classes of the two ‘factors’ in the fusion, and is also standard.

3. If $\mathcal{E}$ is only a Hilbert von Neumann $A_2$-module, and $\mathcal{F}$ is a Hilbert von Neumann $A_2 - A_3$-bimodule, their Connes fusion $\mathcal{E} \otimes_{A_2} \mathcal{F}$ would still make sense as a Hilbert von Neumann $A_3$-module.
1.4 Examples

We now discuss some examples of Hilbert von Neumann (bi)modules.

1. The simplest (non-degenerate) example is obtained when \( A_j = \mathcal{L}(\mathcal{H}_j), \pi_j = \text{id}_{A_j} \) for \( j = 1, 2 \) and \( E = \mathcal{L}(\mathcal{H}_2, \mathcal{H}_1) \); all the verifications reduce just to matrix multiplication.

2. Suppose \( A_2 \) is a unital von Neumann subalgebra of \( A_1 \), and suppose there exists a faithful normal conditional expectation \( \epsilon : A_1 \to A_2 \). Let \( \phi_2 \) be a faithful normal state (even semi-finite weight will do). Let \( \phi_1 = \phi_2 \circ \epsilon, \mathcal{H}_j = L^2(A_j, \phi_j) \), and let \( \pi_j \) be the left regular representation of \( A_j \) on \( \mathcal{H}_j \). Write \( U \) for the natural isometric identification of \( \mathcal{H}_2 \) as a subspace of \( \mathcal{H}_1 \) (so that the ‘Jones projection’ will be just \( UU^* \)). Finally, define

\[
\mathcal{E}_{(A_2 \subset A_1)} = (\pi_1(A_1)U, (\pi_1, \mathcal{H}_1), (\pi_2, \mathcal{H}_2))
\]

In this case, we find that \([EE^*] = [\pi_1(A_1)e\pi_1(A_1)]\), and we find the ‘basic construction of Jones appearing naturally in this context.

Further, it is a consequence of the uniqueness assertion in Theorem 1.2.3 that \( E_\epsilon \cong \mathcal{E}_{(A_2 \subset A_1)} \).

3. Suppose \((M, \mathcal{H}, \mathcal{J}, P)\) is a standard form of \( M \) in the sense of [Haa75]. As indicated in [Haa], there is a canonical ‘implementing’ unitary representation

\[
\text{Aut}(M) \ni \theta \mapsto u_\theta \in \mathcal{L}(\mathcal{H})
\]

satisfying \( u_\theta x u_\theta^* = \theta(x) \forall x \in M \). We have the natural Hilbert von Neumann \( M - M \) bimodule given by

\[
\mathcal{E}_\theta = (Mu_\theta, (\text{id}_M, L^2(M)), (\text{id}_M, L^2(M)))
\]
4. If $\theta, \phi \in \text{Aut}(M)$, $M$ are as in the previous example, we see now that ‘Connes fusion corresponds to composition’ in this case:

$$\mathcal{E}_\theta \otimes_M \mathcal{E}_\phi \cong \mathcal{E}_{\theta \phi}$$

(Reason: The ‘$u$’ in the definition of Connes fusion is just $\text{id}_M$, while

$$Mu_\theta Mu_\phi = M\theta(M)u_\theta u_\phi = Mu_{\theta \phi}.$$)

**Proposition 1.4.1.** If $\theta, \phi \in \text{Aut}(M)$ are as in Example (4) above, then $\mathcal{E}_\theta \cong \mathcal{E}_\phi$ if and only if $\theta$ and $\phi$ are inner conjugate.

*Proof.* First, note that any $M$-linear unitary operator on $L^2(M)$ has the form $\mathcal{J}v^* \mathcal{J}$ for some unitary $v \in M$, where of course $\mathcal{J}$ denotes the modular conjugation operator. Observe next that each $u_\theta$ commutes with $\mathcal{J}$ since $\theta$ is a $^*$-preserving map, and hence, for any $x \in M$, we have

$$u_\theta \mathcal{J}v^* \mathcal{J} = \mathcal{J} \theta(v^*) \mathcal{J} u_\theta \quad (1.4.1)$$

If $\mathcal{E}_\theta$ is isomorphic to $\mathcal{E}_\phi$, there must exist unitary $v_1, v_2 \in M$ such that

$$Mu_\phi = \mathcal{J} v_1^* \mathcal{J} Mu_\theta \mathcal{J} v_2 \mathcal{J}$$

$$= \mathcal{M} \mathcal{J} v_1^* \mathcal{J} u_\theta \mathcal{J} v_2 \mathcal{J}$$

$$= \mathcal{M} \mathcal{J} v_1^* \mathcal{J} \theta(v_2) \mathcal{J} u_\theta$$

$$= \mathcal{M} \mathcal{J} v_1^* \theta(v_2) \mathcal{J} u_\theta ;$$

in particular, there must exist a $y \in M$ such that

$$u_\phi = y \mathcal{J} v_1^* \theta(v_2) \mathcal{J} u_\theta .$$

We find that $y$ is necessarily unitary and hence, writing $u$ for $y$ and $v$ for $v_1^* \theta(v_2)$, we see
that there must be a unitary $u \in M$ such that

$$
\phi(x) = u_\phi xu_\phi^* \\
= uJvJu_\phi xu_\phi^* Jv^* Ju^* \\
= uJvJ\theta(x)Jv^* Ju^* \\
= u\theta(x)u^* .
$$

In other words, $\phi$ and $\theta$ are indeed inner conjugate.

Conversely, if $\phi(\cdot) = u\theta(\cdot)u^*$ for some unitary $u \in M$, we see that $u_\phi = uJu_\phi u_\theta = uu_\theta J\theta^{-1}(u)J$; so we find that $w_1 = id_M$ and $w_2 = J\theta^{-1}(u)^*J$ define $M$-linear unitary operators on $L^2(M)$ such that $Mu_\phi = Mu_\theta w_2^* = w_1 Mu_\theta w_2^*$, thereby establishing that $\mathcal{E}_\theta \cong \mathcal{E}_\phi$. \qed
Chapter 2

On Extendability of endomorphisms and of $E_0$-semigroups on factors

In this chapter we begin with a von Neumann algebraic version of the elementary but extremely useful fact about being able to extend inner-product preserving maps from a total set of the domain Hilbert space to an isometry defined on the entire domain. This leads us to the notion of when a well-behaved (equi-modular, as we term it) endomorphism of a factorial probability space $(M, \phi)$ admits a natural extension to an endomorphism of $L^2(M, \phi)$. After deriving some equivalent conditions under which an endomorphism is extendable, we exhibit examples of such extendable endomorphisms.

We then pass to $E_0$-semigroups $\alpha = \{\alpha_t : t \geq 0\}$ of factors, and observe that extendability of this semigroup (i.e., extendability of each $\alpha_t$) is a cocycle-conjugacy invariant of the semigroup. We conclude by giving examples of extendable $E_0$–semigroups, and by showing that the Clifford flow on the hyperfinite $II_1$ factor is not extendable, neither is the free flow.

Our notion of extendable $E_0$-semigroups is related to a notion called ‘regular semigroups’ in [ABS01], where they erroneously claim to prove that the Clifford flow is extendable.
2.1 An existence result

We start by setting up some notation. For any index set $I$, we write $I^* = \bigcup_{n=0}^{\infty} I^n$ where $I^0 = \emptyset$, and $\mathbb{I} \cup J = (i_1, \cdots, i_m) \cup (j_1, \cdots, j_n) = (i_1, \cdots, i_m, j_1, \cdots, j_n)$ whenever $\mathbb{I} = (i_1, \cdots, i_m), J = (j_1, \cdots, j_n) \in I^*$.

By a von Neumann probability space, we shall mean a pair $(M, \phi)$ consisting of a von Neumann algebra and a normal state. For such an $(M, \phi)$, and an $x \in M$, we shall write $\hat{x} = \lambda_M(x) \hat{1}_M$ and $\hat{1}_M$ for the cyclic vector for $\lambda_M(M)$ in $L^2(M, \phi)$, where $\lambda_M$ is the left regular representation of $M$.

Recall that the central support of the normal state $\phi$ is the central projection $z(=: z_{\phi})$ such that $\ker(\lambda_M) = M(1 - z)$. Clearly $z_{\phi} = 1_M$ if $M$ is a factor.

Finally, if $\{x_i : i \in I\} \subset M$, and $\mathbb{I} = (i_1, \cdots, i_n) \in I^n$, we shall write $x_{\mathbb{I}} = x_{i_1}x_{i_2} \cdots x_{i_n}$.

We also use $[S]$ either to denote the norm (respectively strong) closure of the span, for $S \subseteq H$ (respectively $S \subseteq L(H)$), for any Hilbert space $H$.

**Proposition 2.1.1.** Let $(M_i, \phi_i), i = 1, 2$ be von Neumann probability spaces with $z_i = z_{\phi_i}$. Suppose $S^{(j)} = \{x_i^{(j)} : i \in I\}$ is a set of self-adjoint elements which generates $M_j$ as a von Neumann algebra, for $j = 1, 2$. (Note the crucial assumption that both the $S^{(j)}$ are indexed by the same set.) Suppose

$$\phi_1(x_i^{(1)}) = \phi_2(x_i^{(2)}) \ \forall \mathbb{I} \in I^*.$$  \hspace{1cm} (2.1.1)

Then there exists a unique isomorphism $\theta : M_1 z_1 \to M_2 z_2$ such that $\phi_2 \circ \theta |_{M_1 z_1} = \phi_1 |_{M_1 z_1}$ and $\theta(x_i^{(1)} z_1) = x_i^{(2)} z_2 \ \forall i \in I$.

**Proof.** The hypothesis implies that, for $j = 1, 2$, the set $\{x_i^{(j)} : \mathbb{I} \in I^*\}$ linearly spans a *-subalgebra which is necessarily $\sigma$-weakly dense in $M_j$. Since $\langle \hat{x}_i^{(1)}, \hat{x}_j^{(1)} \rangle = \langle \hat{x}_i^{(2)}, \hat{x}_j^{(2)} \rangle \ \forall \mathbb{I}, \mathbb{J} \in I^*$, there exists a unique unitary operator $u : L^2(M_1, \phi_1) \to L^2(M_2, \phi_2)$ such that $u \hat{x}_i^{(1)} = \hat{x}_i^{(2)} \ \forall \mathbb{I} \in I^*$.
Now observe that

\[
    u\lambda_{M_1}(x_1^{(1)})u^*x_1^{(2)} = u\lambda_{M_1}(x_1^{(1)})\hat{x}_1^{(1)} = u\hat{x}_1^{(1)} = \hat{x}_1^{(2)} = \lambda_{M_2}(x_1^{(2)}) \hat{x}_1^{(2)};
\]

and hence that \( u\lambda_{M_1}(x_1^{(1)})u^* = \lambda_{M_2}(x_1^{(2)}) \forall I \in I \).

On the other hand, \( \{ x \in M_1 : u\lambda_{M_1}(x)u^* \in \lambda_{M_2}(M_2) \} \) is clearly a von Neumann subalgebra of \( M_1 \); since this has been shown to contain each \( x_1^{(1)} \), we may deduce that this must be all of \( M_1 \). Now notice that \( L^2(M_j, \phi_j) = L^2(M_j z_j, \phi_j|_{M_j z_j}) \), that \( \lambda_{M_j}(x) = \lambda_{M_j z_j}(xz_j) \forall x \in M_j \), and that \( \lambda_{M_j z_j} \) maps \( M_j z_j \) isomorphically onto its image.

The proof is completed by defining

\[
    \theta(x) = \lambda_{M_2 z_2}^{-1}(u\lambda_{M_1}(x)u^*) \forall x \in M_1 z_1.
\]

\[\boxed{}\]

**Remark 2.1.2.**

1. In the proposition, even if it is the case that \( N := \{ x_i^{(2)} : i \in I \}'' \subset M_2 \), we can still apply the result to \( (N, \phi_2|_N) \) in place of \( (M_2, \phi_2) \) and deduce the existence of a normal homomorphism of \( M_1 \) into \( M_2 \) which sends \( x_i^{(1)} \) to \( x_i^{(2)} z \) for each \( i \) (and \( 1_{M_1} \) to the projection \( z = z_{\phi_2|_N} \in N \)).

2. In the special case that the \( N \) of the last paragraph is a factor, the \( z \) there is nothing but \( id_{M_2} \) and in particular, Proposition 2.1.1 can be strengthened as follows:

Let \( (M_j, \phi_j), j = 1, 2 \) be von Neumann probability spaces. Suppose \( S_j = \{ x_i^{(j)} : i \in I \} \subset M_j \) is a set of self-adjoint elements such that \( S_1'' = M_1 \) and \( S_2'' \) is a factor \( N \subset M_1 \). Suppose

\[
    \phi_1(x_1^{(1)}) = \phi_2(x_1^{(2)}) \forall I \in I^*.
\]

(2.1.2)
Then there exists a unique normal ∗-homomorphism \( \theta : M_1 \to N \subset M_2 \) such that \( \theta(x_i^{(1)}) = x_i^{(2)} \) for all \( i \in I \).

**Corollary 2.1.3.**  
1. If \( \theta_i \) is a \( \phi_i \)-preserving unital endomorphism of a von Neumann probability space \((M_i, \phi_i), \) for \( i \in \Lambda, \) then there exists:

   (a) a unique unital endomorphism \( \otimes_{i \in \Lambda} \theta_i \) of the tensor product \((\otimes_{i \in \Lambda} M_i, \otimes_{i \in \Lambda} \phi_i) \)

   such that

   \[
   (\otimes_{i \in \Lambda} \theta_i)(\otimes_{i \in \Lambda} x_i) = z(\otimes_{i \in \Lambda} \theta_i(x_i)) \quad \forall x_i = x_i^* \in M_i;
   \]

   (b) a unique unital endomorphism \( \ast_{i \in \Lambda} \theta_i \) of the free product (see [VDN92]) \((\ast_{i \in \Lambda} M_i, \ast_{i \in \Lambda} \phi_i) \)

   such that

   \[
   (\ast_{i \in \Lambda} \theta_i)(\lambda(x_j)) = z\lambda(\theta_j(x_j)) \quad \forall x_j \in M_j
   \]

   where we simply write \( \lambda \) for each ‘left-creation representation’ \( \lambda : M_j \to \mathcal{L}(\ast_{i \in \Lambda} L^2(M_i, \phi_i)) \) for every \( j \in I. \)

In the above existence assertions, the symbol \( z \) represents an appropriate projection (= image of the identity of the domain of the endomorphism in question).

2. If each \( M_i \) above is a factor, then (the \( z \) in the above statement can be ignored, as it is the identity of the appropriate algebra) and all endomorphisms above are unital monomorphisms.

**Proof.** It is not hard to see that Remark 2.1.2(1) is applicable to \( S^{(1)} = \{ \otimes_i x_i : x_i = x_i^* \in M_i, x_i = 1_{M_i} \text{ for all but finitely many } i \} \) and

\[
S^{(2)} = \{ \otimes_i \theta_i(x_i) : x_i = x_i^* \in M_i, x_i = 1_{M_i} \text{ for all but finitely many } i \} \quad \text{(resp., } S^{(1)} = \{ \lambda(x_i) : i \in \Lambda, x_i = x_i^* \in M_i, \phi_i(x_i) = 0 \} \text{ and } S^{(2)} = \{ \lambda(\theta_i(x_i)) : i \in \Lambda, x_i = x_i^* \in M_i, \phi_i(x_i) = 0 \}).
\]

The second fact follows from Remark 2.1.2(2) because normal endomorphisms of factors are unital isomorphisms onto their images, and the tensor (resp., free) product of factors is a factor. \( \square \)
For later reference, the next lemma identifies the central support $z_\phi$ of a normal state $\phi$ on a von Neumann algebra in the simple special case when $\phi$ is a vector-state.

**Lemma 2.1.4.** Suppose $N \subset \mathcal{L}(\mathcal{H})$ is a von Neumann algebra, $\xi \in \mathcal{H}$ is a unit vector, and $\phi$ is the vector state defined on $N$ by $\phi(x) = \langle x\xi, \xi \rangle$. If $\mathcal{H}_0 = N\xi$, then a candidate for ‘the GNS triple for $(N,\phi)$’ is given by $(\mathcal{H}_0, id_N|_{\mathcal{H}_0}, \xi)$. In particular, the central support of $\phi$ is given by the projection $z = \bigwedge\{p \in N : \text{ran } p \supset \mathcal{H}_0\}$ and $\text{ran } z = [N'N\xi]$. 

**Proof.** It is clear that $\xi$ is a cyclic vector for $N|_{\mathcal{H}_0}$ and the assertion regarding GNS triples follows. Hence if $z \in \mathcal{P}(Z(N))$ is such that $N(1 - z) = \ker id_N|_{\mathcal{H}_0}$, then $z = \bigwedge\{p \in \mathcal{P}(N) : p|_{\mathcal{H}_0} = (1_N)|_{\mathcal{H}_0}\}$, i.e., $z = \bigwedge\{p \in \mathcal{P}(N) : \text{ran } p \supset \mathcal{H}_0\}$. As $z$ is the smallest projection in $(N \cap N')$ whose range contains $N\xi$, or equivalently the smallest subspace containing $[N\xi]$ which is invariant under $(N \cap N')'$, equivalently invariant under $N'N$, the last assertion follows. \hfill \Box

### 2.2 Extendable endomorphisms

For the remainder of this paper, we make the standing assumption that $\phi$ is a faithful normal state on a factor $M$. We identify $x \in M$ with $\lambda_M(x)$, and simply write $J$ and $\Delta$ for the modular conjugation operator $J_\phi$ and the modular operator $\Delta_\phi$ respectively. Recall, thanks to the Tomita-Takesaki theorem that $j = J(\cdot)J$ is a *-preserving conjugate-linear isomorphism of $\mathcal{L}(L^2(M,\phi))$ onto itself, which maps $M$ and $M'$ onto one another, and that $\hat{1}_M$ is also a cyclic and separating vector for $M'$. We shall assume that $\theta$ is a normal unital *-endomorphism which preserves $\phi$. The invariance assumption $\phi \circ \theta = \phi$ implies that there exists a unique isometry $u_\theta$ on $L^2(M,\phi)$ such that $u_\theta x \hat{1}_M = \theta(x) \hat{1}_M$ and equivalently, that $u_\theta x = \theta(x) u_\theta \forall x \in M$ and $u_\theta \hat{1}_M = \hat{1}_M$.

**Definition 2.2.1.** If $M, \phi, \theta$ are as above, and if the associated isometry $u_\theta$ of $L^2(M,\phi)$ commutes with the modular conjugation operator $J(= J_\phi)$, we shall simply say $\theta$ is a equi-modular (as this is related to endomorphisms commuting with the modular au-
tomorphism group) endomorphism of the factorial non-commutative probability space $(M, \phi)$.

**Remark 2.2.2.** It is true that if $\theta$ is an equi-modular endomorphism of a factor $M$ as above, then there always exists a $\phi$-preserving faithful normal conditional expectation $E : M \to \theta(M)$, and in fact $u_\theta u_\theta^*$ is the Jones projection associated to this conditional expectation. For this, notice to start with, that as $\theta$ is a $*$-homomorphism, $u_\theta$ commutes with the conjugate-linear Tomita operator $S$ (which has $M \hat{1}_M$ as a core and maps $x \hat{1}_M$ to $x^* \hat{1}_M$ for $x \in M$). More precisely, we have $Su_\theta \supset u_\theta S$, meaning that whenever $\xi$ is in the domain of $S$, so is $u_\theta \xi$ and $Su_\theta \xi = u_\theta S \xi$ holds. Since $u_\theta$ commutes with $J$ and $S = J \Delta^{1/2}$, we have $\Delta^{1/2} u_\theta \supset u_\theta \Delta^{1/2}$, and so $\Delta^t$ commutes with $u_\theta$ for any $t \in \mathbb{R}$.

Hence, conclude that for $x \in M$ and $t \in \mathbb{R}$, we have

$$
\theta(\sigma_t^\phi(x)) \hat{1}_M = u_\theta \Delta^t x \Delta^{-t} \hat{1}_M = u_\theta \Delta^t x \hat{1}_M = \Delta^t u_\theta x \hat{1}_M = \Delta^t \theta(x) \hat{1}_M = \sigma_t^\phi(\theta(x)) \hat{1}_M.
$$

As $\hat{1}_M$ is a separating vector for $M$, deduce that

$$
\theta(\sigma_t^\phi(x)) = \sigma_t^\phi(\theta(x)) \forall x \in M, t \in \mathbb{R}.
$$

Hence $\sigma_t^\phi(\theta(M)) = \theta(M) \forall t \in \mathbb{R}$ and it follows from Takesaki’s theorem (see [Tak72, Section 4]) that there exists a unique $\phi$-preserving conditional expectation $E$ of $M$ onto the subfactor $P = \theta(M)$. It is true, as the definition shows, that $e_\theta = u_\theta (u_\theta)^*$ is the orthogonal projection onto $[P \hat{1}_M]$ and $E(x) e_\theta = e_\theta x e_\theta \forall x \in M$.

**Theorem 2.2.3.** Suppose $\theta$ is an equi-modular endomorphism of a factorial non-commutative probability space $(M, \phi)$. Then,

1. The equation $\theta' = j \circ \theta \circ j$ defines a unital normal $*$-endomorphism of $M'$ which preserves $\phi' = \phi \circ j$; and
2. We have an identification

$$L^2(M', \phi') = L^2(M, \phi)$$

$$\hat{1}_{M'} = \hat{1}_M$$

$$u_{\theta'} = u_{\theta}$$

3. There exists a unique endomorphism $\theta^{(2)}$ of $\mathcal{L}(L^2(M, \phi))$ satisfying

$$\theta^{(2)}(xj(y)) = \theta(x)j(\theta(y))z, \quad \forall x, y \in M$$

where $z = \wedge\{p \in (\theta(M) \cup \theta'(M'))'' : \text{ran}(p) \supset \{\hat{\theta}(x) : x \in M\}\}$.

Proof. 1. It is clear that $\theta' = j \circ \theta \circ j$ is a unital normal linear *-endomorphism of $M'$ and that

$$\overline{\phi} \circ \theta' = \overline{\phi} \circ \theta' = (\phi \circ j) \circ (j \circ \theta \circ j) = (\phi \circ \theta) \circ j = \phi \circ j = \overline{\theta'},$$

thereby proving (1).

2. This follows from the facts that $\hat{1}_M$ is a cyclic and separating vector for $M$ and
hence also for $M'$, the definition of $\phi'$ which guarantees that

$$\langle j(x)\hat{1}_{M'}, j(y)\hat{1}_{M'} \rangle = \phi'(j(y)\ast j(x))$$

$$= \phi'(j(y^*x))$$

$$= \phi(y \ast x)$$

$$= \phi(x^*y)$$

$$= \langle y\hat{1}_M, x\hat{1}_M \rangle$$

$$= \langle j(Jx\hat{1}_M), j(Jy\hat{1}_M) \rangle$$

$$= \langle j(x)\hat{1}_M, j(y)\hat{1}_M \rangle$$

and the definitions of the ‘implementing isometries’, which show that

$$u_{\theta'}(j(x)\hat{1}_{M'}) = \theta'(j(x))\hat{1}_{M'}$$

$$= j(\theta(x))\hat{1}_{M'}$$

$$= J\theta(x)\hat{1}_M$$

$$= J\theta(x)\hat{1}_M$$

$$= J\theta(x)\hat{1}_M$$

$$= J\theta(x)\hat{1}_M$$

$$= u_{\theta}j(x)\hat{1}_{M'}$$

$$= u_{\theta}j(x)\hat{1}_{M'}.$$
3. Notice that if \( x, y \in M \), then

\[
\langle \theta(x)\mathcal{J}\theta(y)\mathcal{J}1_M, \hat{1}_M \rangle = \langle \theta(x)\mathcal{J}u_\theta y\hat{1}_M, \hat{1}_M \rangle = \langle \theta(x)u_\theta Jy\hat{1}_M, \hat{1}_M \rangle = \langle u_\theta x Jy\hat{1}_M, \hat{1}_M \rangle = \langle x Jy\hat{1}_M, \hat{1}_M \rangle,
\]

where we have used the fact that \( \theta \) is equi-modular.

Set \( S^1 = \{ xj(y) : x = x^*, y = y^*, x, y \in M \} \), and \( S^{(2)} = \{ \theta(x)j(\theta(y)) : xj(y) \in S^{(1)} \} \), and deduce from the factoriality of \( M \) that \( S^{(1)''} = \mathcal{L}(L^2(M, \phi)) \).

Now we wish to apply Remark 2.1.2(1) with \( N = S^{(2)''} = \theta(M) \vee j(\theta(M)) \) (where, both here and in the sequel, we write \( A \vee B = (A \cup B)'' \) for the von Neumann algebra generated by von Neumann algebras \( A \) and \( B \)) and \( \phi_1 = \phi_2 = \langle (\cdot)\hat{1}_M, \hat{1}_M \rangle \).

For this, deduce from Lemma 2.1.4 that

\[
z = \wedge\{ p \in \mathcal{P}(N) : \text{ran } p \supset N\hat{1}_M \} = \wedge\{ p \in \mathcal{P}(N) : \text{ran } p \supset \{ \theta(x)\hat{1}_M, \theta'(j(x))\hat{1}_M : x \in M \} \}
= \wedge\{ p \in \mathcal{P}(N) : \text{ran } p \supset \{ \theta(x) : x \in M \} \}
\]

and the proof of the theorem is complete.

\[ \square \]

**Remark 2.2.4.** It must be observed that the projection \( z \) of Theorem 2.2.3 is nothing but the central support of the projection \( e_\theta = u_\theta u_\theta^* \in P' \cap P_1 \) where \( P = \theta(M) \subset M \subset P_1 \) is
Jones’ basic construction (thus, \( P_1 = \mathcal{J}P'\mathcal{J} \)) since, by Lemma 2.1.4, we have:

\[
\text{ran } z = [(P \vee \mathcal{J}P\mathcal{J})(P \vee \mathcal{J}P\mathcal{J})\hat{1}_M] = [(P' \cap P_1)e_\theta L^2(M, \phi)].
\]

This is because

\[
[(P \vee \mathcal{J}P\mathcal{J})\hat{1}_M] = [P\mathcal{J}\mathcal{J}\hat{1}_M] = [P\mathcal{J}P\hat{1}_M] \\
= [P\mathcal{J}u_\theta M\hat{1}_M] = [Pu_\theta M\hat{1}_M] \\
= [Pu_\theta M\hat{1}_M] = [P\hat{1}_M].
\]

In particular, since \( e_\theta \) is a minimal projection in \( P' \cap P_1 \), its central support \( z \) in \( P' \cap P_1 \) is 1 if and only if \( P' \cap P_1 \) is a type I factor. In the following corollary, we continue to use the symbols \( P \) and \( P_1 \) with the meaning attributed to them here.

The following corollary is an immediate consequence of Lemma 2.1.4, Theorem 2.2.3 and Remark 2.2.4.

**Corollary 2.2.5.** Let \( \theta \) be a equi-modular endomorphism of a factorial non-commutative probability space \((M, \phi)\) in standard form (i.e., viewed as embedded in \( \mathcal{L}(L^2(M, \phi)) \) as above). The following conditions on \( \theta \) are equivalent:

1. there exists a unique unital normal \(*\)-endomorphism \( \theta^{(2)} \) of \( \mathcal{L}(L^2(M, \phi)) \) such that \( \theta^{(2)}(x) = \theta(x) \) and \( \theta^{(2)}(j(x)) = j(\theta(x)) \) for all \( x \in M \).
2. \( P \vee \mathcal{J}P\mathcal{J} \) is a factor; and in this case, it is necessarily a type I factor.
3. \( (P \vee \mathcal{J}P\mathcal{J})' = P' \cap P_1 \) is a factor; and in this case, it is necessarily a type I factor.
4. \( \{x\hat{y} : x \in P' \cap P_1, y \in P \} \) is total in \( L^2(M, \phi) \).

An endomorphism of a factor which satisfies the equivalent conditions above will be said to be **extendable**.
Remark 2.2.6. It should be noted that extendability is not a property of just an endomorphism $\theta$ but it is also dependent on a state which is not only left invariant under the endomorphism but must also satisfy the requirement we have called equi-modular. Strictly speaking, we should probably talk of $\phi$-extendability, but shall not do so in the interest of notational convenience.

Theorem 2.2.7. Let the notation be as above. Then the following conditions are equivalent:

1. $\theta$ is extendable.

2. $M = (M \cap \theta(M)') \vee \theta(M)$. (Note that the right-hand side is naturally identified with the von Neumann algebra tensor product $(M \cap \theta(M)') \otimes \theta(M)$ in this case.)

Proof. Recall that $P = \theta(M)$ is globally preserved by the modular automorphism group $\{\sigma^\phi_t\}_{t \in \mathbb{R}}$ and there exists a $\phi$-preserving faithful normal conditional expectation $E$ from $M$ onto $P$. Thus $(M \cap P') \vee P$ is naturally identified with the von Neumann algebra tensor product $(M \cap P') \otimes P$ (see [Tak72, Corollary 1]). If we assume the second condition in the statement, the basic construction for $P \subset M$ essentially comes from that of $C \subset (M \cap P')$, and so $P' \cap P_1$ is a type I factor. This means that $\theta$ is extendable.

Assume that $\theta$ is extendable now. We will show that $Q := (M \cap P') \vee P$ coincides with $M$. For this, it suffices to show $[Q \hat{1}_M] = L^2(M, \phi)$. Indeed, since $P$ is globally preserved by $\sigma^\phi_t$, so is $Q$, and there exists a $\phi$-preserving faithful normal conditional expectation from $M$ onto $Q$ thanks to Takesaki’s theorem. Thus if $Q$ were a proper subalgebra of $M$, $[Q \hat{1}_M]$ would be a proper subspace of $L^2(M, \phi)$.

Let $\hat{E}$ be the dual operator valued weight from $P_1$ to $M$ (see [Kos86] for the definition of $\hat{E}$ and its properties). Since $E \circ \hat{E}(e_\theta) = 1 < \infty$ and $P' \cap P_1$ is a factor, the restriction of $E \circ \hat{E}$ to the type I factor $P' \cap P_1$ is a faithful normal semifinite weight (see [ILP98, Lemma 2.5]). Thus there exists a (not necessarily bounded) non-singular positive operator...
\( \rho \) affiliated to \( P' \cap P_1 \) satisfying \( \sigma_t^{E \circ \hat{E}} = \text{Ad}\rho^t \) and

\[
E \circ \hat{E}(a) = \lim_{n \to \infty} \text{Tr}(\rho(1 + \frac{1}{n}\rho)^{-1}a), \quad \forall a \in (P' \cap P_1)_+,
\]

where \( \{\sigma_t^{E \circ \hat{E}}\}_{t \in \mathbb{R}} \) is the relative modular automorphism group (the restriction of \( \{\sigma_t^{\phi \circ \hat{E}}\}_{t \in \mathbb{R}} \) to \( P' \cap P_1 \)). Note that the trace \( \text{Tr} \) makes sense as \( P' \cap P_1 \) is a type I factor.

From the above argument we see that there exists a partition of unity \( \{e_i\}_{i \in I} \) consisting of minimal projections \( e_i \in P' \cap P_1 \) with \( E \circ \hat{E}(e_i) < \infty \). Since \( e_\theta \) is a minimal projection in \( P' \cap P_1 \) satisfying \( \sigma_t^{E \circ \hat{E}}(e_\theta) = e_\theta \) and \( E \circ \hat{E}(e_\theta) = 1 \), we may assume \( 0 \in I \) and \( e_0 = e_\theta \). Let \( \{e_{ij}\}_{i,j \in I} \) be a system of matrix units in \( P' \cap P_1 \) satisfying \( e_{ii} = e_i \). Then we can apply the push down lemma \([ILP98, \text{Proposition 2.2}]\) to \( e_0i \), and we have \( e_0i = e_\theta q_i \), where \( q_i = \hat{E}(e_0i) \in P' \cap M \). Now for any \( x \in M \), we have

\[
x \hat{1}_M = \sum_{i \in I} e_{ii} x \hat{1}_M = \sum_{i \in I} q_i^* e_\theta q_i x \hat{1}_M = \sum_{i \in I} q_i^* E(q_i x) \hat{1}_M,
\]

which shows \( [Q \hat{1}_M] = L^2(M, \phi) \). \( \square \)

### 2.3 Examples of Extendable Endomorphisms

Note that any automorphism on a factor is extendable, since the conditions in Corollary 2.2.5 are satisfied.

Let \( \mathcal{R} \) denote the hyperfinite \( II_1 \) factor and \( M \) be any \( II_1 \) factor which is also a McDuff factor; i.e., \( M \otimes \mathcal{R} \cong M \). Let \( \alpha : M \otimes \mathcal{R} \mapsto M \) be an isomorphism and \( \beta : M \mapsto M \otimes \mathcal{R} \) be the monomorphism defined by \( \beta(m) = m \otimes 1 \), for \( m \in M \). Let us write \( \theta = \beta \circ \alpha \). so \( \theta \) is an endomorphism of \( M \otimes \mathcal{R} \) such that \( \theta(M \otimes \mathcal{R}) = M \otimes 1 \). As \( M \otimes \mathcal{R} \) is a \( II_1 \) factor, the endomorphism \( \theta \) is necessarily equi-modular. Now by corollary 2.2.5, showing that \( \theta \) is extendable is equivalent to showing that \( \{\theta(M \otimes \mathcal{R}) \vee J\theta(M \otimes \mathcal{R})\mathcal{J}\} \) is a type I factor, where \( \mathcal{J} \) is the modular conjugation of \( M \otimes \mathcal{R} \), which, of course, is \( \mathcal{J}_M \otimes \mathcal{J}_R \).
Note that

\[
\{ \theta(M \otimes \mathcal{R}) \vee \mathcal{J} \theta(M \otimes \mathcal{R}) \mathcal{J} \} = \{ M \otimes 1 \vee \mathcal{J} M \mathcal{J} \mathcal{M} \otimes 1 \} \\
= \mathcal{L}(L^2(M) \otimes 1)
\]

So \( \{ \theta(M \otimes \mathcal{R}) \vee \mathcal{J} \theta(M \otimes \mathcal{R}) \mathcal{J} \} \) is a type \( I \) factor. That is \( \theta \) is extendable.

### 2.4 Extendability for \( E_0 \)-semigroups

**Definition 2.4.1.** \( \{ \alpha_t : t \geq 0 \} \) is said to be an \( E_0 \)-semigroup on a von Neumann probability space \((M, \phi)\) if:

1. \( \alpha_t \) is a \( \phi \)-preserving normal unital *-homomorphism of \( M \) for each \( t \geq 0 \);
2. \( \alpha_0 = \text{id}_M \) and \( \alpha_s \circ \alpha_t = \alpha_{s+t} \); and
3. \( [0, \infty) \ni t \mapsto \rho(\alpha_t(x)) \) is continuous for each \( x \in M, \rho \in M_* \).

Suppose \( \alpha_t \) is (equi-modal and) extendable for each \( t \), then we say that the \( E_0 \)-semigroup \( \alpha \) is extendable.

**Remark 2.4.2.** A remark along the lines of Remark 2.2.6, with endomorphism replaced by \( E_0 \)-semigroup, is in place here.

**Proposition 2.4.3.** Suppose \( \alpha = \{ \alpha_t : t \geq 0 \} \) is an \( E_0 \)-semigroup on a factorial non-commutative probability space \((M, \phi)\).

1. The equation \( \alpha'_t(x') = j(\alpha_t(j(x'))) \) defines an \( E_0 \)-semigroup on \((M', \phi')\), where \( \phi'(x') = \omega_{1_{M'}}(x') = \langle x' \Gamma_M, \Gamma_M \rangle \);
2. If \( \alpha \) is extendable for each \( t \), then there exists a unique \( E_0 \)-semigroup \( \{ \alpha^{(2)}_t : t \geq 0 \} \) on \((\mathcal{L}(L^2(M, \phi)), \omega_{1_{M'}})\) such that \( \alpha^{(2)}_t(xx') = \alpha_t(x)\alpha'_t(x') \forall x \in M, x' \in M' \).
Proof. Existence of the endomorphisms $\alpha'_t$ and $\alpha^{(2)}_t$ is guaranteed by Corollary 2.2.5. The equation $\alpha'_t = j \circ \alpha_t \circ j$ shows that $\{\alpha'_t : t \geq 0\}$ inherits the property of being an $E_0$-semigroup from that of $\{\alpha_t : t \geq 0\}$. The corresponding property for $\{\alpha^{(2)}_t : t \geq 0\}$ is now seen to follow easily from the uniqueness assertion in Corollary 2.2.5(1). \qed

By using standard arguments from the theory of $E_0$-semigroups on type I factors, we can strengthen Corollary 2.2.5 in the case of $E_0$-semigroups thus:

**Proposition 2.4.4.** Let $\alpha = \{\alpha_t : t \geq 0\}$ be an $E_0$-semigroup on a factorial non-commutative probability space $(M, \phi)$, and suppose $\alpha_t$ is equi-modular for each $t$. Suppose $M$ is acting standardly on $\mathcal{H} = L^2(M)$. Consistent with the notation of Remark 2.2.4, we shall write $P(t) = \alpha_t(M) \subset M \subset P_1(t)$ for Jones’ basic construction.

The following conditions on $\alpha$ are equivalent.

1. $\alpha$ is extendable.

2. $P'(t) \cap P_1(t)$ is either: (i) a factor of type $I_1$ (i.e., is isomorphic to $\mathbb{C}$) and $\alpha_t$ is an automorphism for all $t$; or (ii) a factor of type $I_\infty$ for all $t$ and no $\alpha_t$ is an automorphism.

Proof. $(1) \Rightarrow (2)$ If each $\alpha_t$ is extendable, then $P'(t) \cap P_1(t)$ is a factor of type $I_{n_t}$, say, by Corollary 2.2.5. The first fact to be noted is that if $\{\mathcal{E}_{\alpha^{(2)}_t}(t) : t \geq 0\}$ is the product system associated to the $E_0$-semigroup $\alpha^{(2)}_t$ on $\mathcal{L}(L^2(M))$, then $n_t$ is the dimension of the Hilbert space $\mathcal{E}_{\alpha^{(2)}_t}(t)$. Hence $\{n_t : t \geq 0\}$ is a multiplicative semi-group of integers. Hence either $n_t$ is constant in $t$ (identically 1 or identically infinity).

$(2) \Rightarrow (1)$ follows from Corollary 2.2.5. \qed

**Remark 2.4.5.** Let $\alpha = \{\alpha_t : t \geq 0\}$ be an $E_0$-semigroup on a factorial non-commutative probability space $(M, \phi)$, and suppose $\alpha_t$ is equi-modular for each $t$. If $\alpha_t$ is an extendable endomorphism for some $t > 0$, then $\alpha_s$ is also extendable for all $0 \leq s < t$. Indeed, $\alpha_t$ being extendable means that $M$ as a $P(t) - P(t)$ bimodule is a direct sum of copies of
$P(t)$, and hence $P(t - s)$ as a $P(t) - P(t)$ bimodule is also a direct sum of copies of $P(t)$. This means that $\alpha_{t - s}(M)$ is generated by $\alpha_{t - s}(M) \cap \alpha_t(M)'$ and $\alpha_t(M)$, which means $\alpha_s$ is extendable. Now, since the compositions of extendable endomorphisms are extendable, the $E_0$-semigroup $\alpha$ itself is extendable.

Now let us consider the following spaces:

$$E^{\alpha_t} = \{ T \in \mathcal{L}(L^2(M)) : \alpha_t(x)T = Tx, \text{ for all } x \in M \};$$

$$E^{\alpha'_t} = \{ T \in \mathcal{L}(L^2(M)) : \alpha'_t(x')T = Tx', \text{ for all } x' \in M' \}.$$ 

For every $t \geq 0$, we write $H(t) = E^{\alpha_t} \cap E^{\alpha'_t}$. Then we have the following Lemma.

**Proposition 2.4.6.** Let $\alpha = \{ \alpha_t : t \geq 0 \}$ be an $E_0$-semigroup on a factorial non-commutative probability space $(M, \phi)$ and suppose $\alpha_t$ is equi-modular for each $t$. If $\alpha$ is extendable then

$$H = \{ (t, T) : t \in (0, \infty), T \in H(t) \}$$

is a product system (in the sense of [Arv03]) with the family of unitary maps $u_{st} : H(t) \otimes H(s) \mapsto H(s + t)$, given by

$$u_{st}(T \otimes S) = TS \forall T \in H(t), S \in H(s).$$

**Proof.** Let $\alpha^{(2)} = \{ \alpha^{(2)}_t : t > 0 \}$ be the extension of $\alpha$ on $\mathcal{L}(L^2(M))$. For $t > 0$, consider

$$\mathcal{E}(t) = \{ T \in \mathcal{L}(L^2(M)) : \alpha^{(2)}_t(x)T = Tx, \text{ for all } x \in \mathcal{L}(L^2(M)) \}.$$ 

We shall write $\mathcal{E} = \{ (t, T) : T \in \mathcal{E}(t) \}$; then $\mathcal{E}$ is a product system (see [Arv03]), and $H(t) = \mathcal{E}(t)$ for every $t > 0$. Indeed, if $T \in H(t) = E^{\alpha_t} \cap E^{\alpha'_t}$, then $\alpha_t(m)T = Tm$ for all $m \in M$ and $\alpha'_t(m')T = Tm'$ for all $m' \in M'$. So it is clear that $\alpha^{(2)}_t(x)T = Tx$ for all $x \in M \cup M'$ and hence also for all $x \in (M \vee M') = \mathcal{L}(L^2(M))$. So, $T \in \mathcal{E}(t)$, and $H(t) \subset \mathcal{E}(t)$. The reverse inclusion is immediate from the definition $\alpha^{(2)}_t$. So we have
$H(t) = \mathcal{E}(t)$ and clearly $H$ is a product system.

Now recall that an $E_0$-semigroup $\{\beta_t : t \geq 0\}$ of a von Neumann probability space $(M, \phi)$ is said to be a **cocycle perturbation** of an $E_0$-semigroup $\{\alpha_t : t \geq 0\}$ if there exists a weakly continuous family $\{u_t : t \geq 0\}$ of unitary elements of $M$ such that

1. $u_{t+s} = u_s \alpha_s (u_t)$; and
2. $\beta_t(x) = u_t \alpha_t(x) u_t^*$ for all $x \in M$ and $s, t \geq 0$.

In such a case, we shall simply write

$$\{u_t : t \geq 0\} : \{\alpha_t : t \geq 0\} \simeq \{\beta_t : t \geq 0\}.$$

**Proposition 2.4.7.** Suppose $\beta = \{\beta_t : t \geq 0\}$ is an $E_0$-semigroup on a factorial probability space $(M, \phi)$, which is a cocycle perturbation of another $E_0$-semigroup $\alpha = \{\alpha_t : t \geq 0\}$ on $(M, \phi)$ with $\{u_t : t \geq 0\} : \{\alpha_t : t \geq 0\} \simeq \{\beta_t : t \geq 0\}$. Then

1. $\{j(u_t) : t \geq 0\} : \{\alpha'_t : t \geq 0\} \simeq \{\beta'_t : t \geq 0\}$.
2. If each $\alpha_t$ is extendable, as is each $\beta_t$, then

$$\{u_t j(u_t) : t \geq 0\} : \{\alpha_t^{(2)} : t \geq 0\} \simeq \{\beta_t^{(2)} : t \geq 0\}.$$  

**Proof.** The verifications are elementary and a routine computation. For example, once (1) has been verified, the verification of (2) involves such straightforward computations
as: if we let \( U_t = u_t u'_t \), where we write \( u'_t = j(u_t) \), and if \( x \in M, x' \in M' \), then

\[
U_t \alpha_t(x) U_t^* = u_t \alpha_t(x) u_t^* = \beta_t(x)
\]

\[
U_t \alpha'_t(x') U_t^* = u'_t \alpha'_t(x') u'_t^* = \beta'_t(x')
\]

\[
\beta_t(M) \vee \beta'_t(M') = U_t(\alpha_t(M) \vee \alpha'_t(M')) U_t^*
\]

\[
U_{s+t} = u_{s+t} u'_{s+t} = u_s \alpha_s(u_t) u'_s \alpha'_s(u'_t) = U_s \alpha_s^{(2)}(U_t)
\]

and

\[
\beta_t^{(2)}(xx') = \beta_t(x) \beta'_t(x')
\]

\[
= u_t \alpha_t(x) u_t^* u'_t \alpha'_t(x') u'_t^*
\]

\[
= U_t \alpha_t^{(2)}(xx') U_t^*.
\]

Recall that two \( E_0 \)-semigroups \( \{ \alpha_t : t \geq 0 \} \) and \( \{ \beta_t : t \geq 0 \} \) on a von Neumann algebra \( M \) are said to be **conjugate** if there exists an automorphism \( \theta \) of \( M \) such that \( \beta_t \circ \theta = \theta \circ \alpha_t \) \( \forall t \), while they are said to be **cocycle conjugate** if each is conjugate to a cocycle perturbation of the other.

**Remark 2.4.8.** While the index of \( E_0 \)-semigroups of type \( I_{\infty} \) factors has been well-defined, we may now define the index of an extendable \( E_0 \) semigroup \( \alpha \) of an arbitrary factor as the index of \( \alpha^{(2)} \); and we may infer from Proposition 2.4.7 that the index of an extendable \( E_0 \)-semigroup of an arbitrary factor is invariant under cocycle conjugacy - in the restricted sense that cocycle conjugate extendable \( E_0 \)-semigroups have the same index. (One has to exercise some caution here in that there is a problem with invariance...
of equi-modularity under cocycle conjugacy!) It is to be noted from Corollary 2.2.5 that
the extendability of an $E_0$-semigroup, each of whose endomorphisms is equi-modular,
is a property which is invariant under cocycle conjugacy within the class of such $E_0$-
semigroups.

**Proposition 2.4.9.** If $\alpha = \{\alpha_t : t \geq 0\}$ (resp., $\beta = \{\beta_t : t \geq 0\}$) is an extendable
$E_0$-semigroup of a factor $M$ (resp., $N$), then $\alpha \otimes \beta = \{\alpha_t \otimes \beta_t : t \geq 0\}$ is an extendable
$E_0$-semigroup of the factor $M \otimes N$, and in fact,

$$(\alpha \otimes \beta)^{(2)} = \alpha^{(2)} \otimes \beta^{(2)}.$$  

**Proof.** The hypothesis is that $\alpha_t(M) \vee J\alpha_t(M)J$ and $\beta_t(N) \vee J\beta_t(N)J$ are factors,
for each $t \geq 0$, while the conclusions follow from the definition of $\alpha \otimes \beta$. \qed

### 2.5 Examples

First we give examples of extendable $E_0$–semigroups. Throughout this section, let $\mathcal{H} = L^2(0, \infty) \otimes \mathcal{K}$, be the real Hilbert space of square integrable functions taking values in a
real Hilbert space $\mathcal{K}$. We always denote by $(\cdot)_{\mathbb{C}}$ the complexification of $(\cdot)$. Let $s_t$ be the
shift semigroup on $\mathcal{H}_{\mathbb{C}}$ defined by

$$(s_t f)(s) = \begin{cases} 0, & p < t, \\ f(p-t), & p \geq t. \end{cases}$$

Thus $(s_t : t \geq 0)$ is a semigroup of isometries, and we denote its restriction to $\mathcal{H}$ also by
$
\{s_t\}$.

For the first set of examples, given by ‘canonical commutation relations’, we only
need complex Hilbert spaces. Let $R \geq 1$ be a complex linear operator on $\mathcal{H}_{\mathbb{C}}$ such that
$T = \frac{1}{2}(R - 1)$ is injective. Consider the the quasi free state on the CCR algebra over $\mathcal{H}_{\mathbb{C}}$
given by
\[ \varphi_R(W(f)) = e^{-\frac{1}{2} \langle R f, f \rangle} = e^{-\frac{1}{2} \| \sqrt{T} f \| ^2} \quad \forall \ f \in \mathcal{H}_C. \]

The space underlying the corresponding GNS representation may be identified with \( \Gamma_s(\mathcal{H}_C) \otimes \Gamma_s(\mathcal{H}_C) \), with the GNS representation being described by
\[ \pi(W(f)) = W_0(\sqrt{1 + T} f) \otimes W_0(q \sqrt{T} f) \quad \forall \ f \in \mathcal{H}_C, \]
where \( \Gamma_s(\cdot) \) is the symmetric Fock space, \( W_0(\cdot) \) is the Weyl operator on \( \Gamma_s(\mathcal{H}_C) \) and \( q \) is an anti-unitary on \( \mathcal{H}_C \) induced by an anti-unitary operator on \( \mathcal{K}_C \). The vacuum vector \( \Omega \otimes \Omega \in \Gamma_s(\mathcal{H}_C) \otimes \Gamma_s(\mathcal{H}_C) \) is the cyclic and separating vector for \( M_R = \{ \pi(W(f)) : f \in \mathcal{H}_C \}'' \) (see [AW63]).

**Example 2.5.1.** Let \( R = \frac{1+\lambda}{1-\lambda} \) with \( \lambda \in (0, 1) \), then it is well-known that \( M_\lambda = M_R \) is a type III\( \lambda \) factor. There exists a unique \( E_0 \)-semigroup \( \beta_t^\lambda \) on \( M_\lambda \) satisfying
\[ \beta_t^\lambda(\pi(W(f))) = \pi(W(s_t f)) \quad \forall \ f \in \mathcal{H}_C. \]
Further, \( \{ \beta_t^\lambda ; t \geq 0 \} \) is equi-modular and the relative commutant is given by
\[ \beta_t^\lambda(M_\lambda)' \cap M_\lambda = \{ \pi(W(f)) : f \in (L^2(0, t) \otimes \mathcal{K})_C \}'' . \]

Now theorem 2.2.7 imply that all these \( E_0 \)-semigroups on type III\( \lambda \) factors are extendable. (See [MS13], where these examples are discussed in more detail.)

We will write \( \mathcal{F}(\mathcal{H}) \) for the anisymmetric Fock space; thus
\[ \mathcal{F}(\mathcal{H}_C) = \mathbb{C}\Omega \oplus \mathcal{H}_C \oplus (\mathcal{H}_C \wedge \mathcal{H}_C) \oplus (\mathcal{H}_C \wedge \mathcal{H}_C \wedge \mathcal{H}_C) \oplus \cdots , \]
where \( \Omega \) is a fixed complex number with modulus 1.
Recall the left creation operator on $\mathcal{F}(\mathcal{H})$ (corresponding to $f \in \mathcal{H}_c$ given by

$$a(f)\Omega = f$$

$$a(f)(\xi_1 \wedge \xi_2 \wedge \cdots \wedge \xi_n) = f \wedge \xi_1 \wedge \xi_2 \wedge \cdots \wedge \xi_n, \xi_i \in \mathcal{H}_c.$$  

These operators obey the canonical anticommutation relations:

$$a(f)a(g) + a(g)a(f) = 0, a(f)a(g)^* + a(g)^*a(f) = \langle f, g \rangle \text{id}_{\mathcal{F}(\mathcal{H})}$$  

for all $f, g \in \mathcal{H}_c$.

For any $f \in \mathcal{H}$, let $u(f) = a(f) + a(f)^*$. It is well-known that the von Neumann algebra

$$\{u(f) : f \in \mathcal{H}\}'' \subseteq \mathcal{L}(\mathcal{F}(\mathcal{H}_c))$$

is the hyperfinite $II_1$ factor $\mathcal{R}$ with cyclic and separating (trace) vector $\Omega$.

**Example 2.5.2.** For every $t \geq 0$ there exist a unique normal, unital $*$-endomorphism $\alpha_t : \mathcal{R} \mapsto \mathcal{R}$ satisfying

$$\alpha_t(u(f)) = u(s_t f) \forall f \in \mathcal{H}_c.$$  

(Although this is a well-known fact, we remark that this is in fact a consequence of Remark 2.1.2 (2).) Then $\alpha = \{\alpha_t : t \geq 0\}$ is an $E_0$-semigroup on $\mathcal{R}$, called the **Clifford flow of rank** $\text{dim} \mathcal{K}$.

It is known from [Ale04] that

$$\alpha_t(M)' \cap M = \{u(f)u(g) : \text{spt}(f), \text{spt}(g) \subset [0,t]\}''.$$  

(2.5.1)

It follows from equation 2.5.1 that if $\text{spt}(f) \subset [0,t]$, then $u(f)\Omega \perp \{(\alpha_t(\mathcal{R})' \cap \mathcal{R})\Omega \cup \alpha_t(\mathcal{R})\Omega\}$; (in fact the same assertion holds for any $a(f_1) \cdots a(f_{2n+1})\Omega$ for any $n$ and any $f_1, \cdots, f_{2n+1}$ with support in $[0,t]$.) Consequently, in view of $\Omega$ being a separating vector for $\mathcal{R}$, it is an easy consequence of Theorem 2.2.7 that the **Clifford**
flow on \( \mathcal{R} \) (of any rank) is not extendable.

The Clifford flows of the hyperfinite \( \text{II}_1 \) factor are closely related to another family of \( E_0 \)-semigroups, called the CAR flows. (We should remember these are CAR flows on type \( \text{II}_1 \) factors, not to be confused with the usual CAR flows on the type \( \text{I} \) factor of all bounded operators on the antisymmetric Fock space.) We recall the definition of CAR algebra and some facts regarding the GNS representations of CAR algebras given by quasi-free states.

For a complex Hilbert space \( K \), the associated CAR algebra \( \text{CAR}(K) \) is the universal \( C^* \)-algebra generated by a unit 1 and elements \( \{a(f) : f \in K\} \), subject to the following relations

(i) \( a(\lambda f) = \lambda a(f) \),

(ii) \( a(f)a(g) + a(g)a(f) = 0 \),

(iii) \( a(f)a^*(g) + a^*(g)a(f) = (f, g)1 \),

for all \( \lambda \in \mathbb{C}, f, g \in K \), where \( a^*(f) = a(f)^* \).

Given a positive contraction \( R \) on \( K \), there exists a unique quasi-free state \( \omega_R \) on \( \text{CAR}(K) \) satisfying

\[
\omega_R(a(x_n) \cdots a(x_1)a(y_1)^* \cdots a(y_m)^*) = \delta_{n,m} \det((Rx_i, y_j)),
\]

where \( \det(\cdot) \) denotes the determinant of a matrix. Let \( (H_R, \pi_R, \Omega_R) \) be the corresponding GNS triple. Then \( M_R = \pi_R(\text{CAR}(K))'' \) is a factor.

Here onwards we fix the contraction with \( R = \frac{1}{2} \), then \( M_R = \mathcal{R} \) is the hyperfinite type \( \text{II}_1 \) factor and \( \omega_R \) is a tracial state. We define the CAR flow on \( \mathcal{R} \) as follows.

Now let \( K = \mathcal{H}_C \). Then there exists a unique \( E_0 \)-semigroup \( \{\alpha_t\} \) on \( \mathcal{R} \) satisfying

\[
\alpha_t(\pi(a(f))) = \pi(a(s_t f)) \quad \forall f \in \mathcal{H}_C.
\]
This $\alpha$ is called as the CAR flow of index $\text{dim} K$ on $\mathcal{R}$.

We recall the following proposition from [Ale04] (see proposition 2.6).

**Proposition 2.5.3.** The CAR flow of rank $n$ on $\mathcal{R}$ is conjugate to the Clifford flow of rank $2n$.

We point out an error in [ABS01] in the following remark.

**Remark 2.5.4.** In section 5, [ABS01], it is claimed that CAR flows of any given rank are extendable. In fact a ‘proof’ is given, for any $\lambda \in (0, \frac{1}{2}]$ with $R = \lambda$, that the corresponding $E_0-$semigroup on $M_R$ is extendable. (When $\lambda \neq \frac{1}{2}$ they are type III factors.) But we have seen that Clifford flows are not extendable. This consequently implies, thanks to proposition 2.5.3, and the invariance of extendability of $E_0-$semigroups of $II_1$ factors (where equi-modularity - with respect to the trace - comes for free), that CAR flows on the hyperfinite type $II_1$ factor $\mathcal{R}$ are not extendable.

In fact it has been proved in [Bik13] that CAR flows flows on any type $III_\lambda$ factors (considered in [ABS01]) are also not extendable.

Let $\Gamma_f(\mathcal{H}_C)$ be the full Fock space associated with a Hilbert space $K$. For $f \in \mathcal{H}$, define $s(f) = \frac{I(f) + I(f)^*}{2}$ where

$$ l(f)\xi = \begin{cases} f & \text{if } \xi = \Omega, \\ f \otimes \xi & \text{if } \langle \xi, \Omega \rangle = 0. \end{cases} $$

The von Neumann algebra $\Phi(\mathcal{K}) = \{ s(f) : f \in \mathcal{H} \}''$, is isomorphic to the free group factor $L(F_\infty)$ and the vacuum is cyclic and separating with $\langle \Omega, x\Omega \rangle = \tau(x)$ (see [VDN92]) a tracial state on $\Phi(\mathcal{K})$.

**Example 2.5.5.** There exists a unique $E_0-$semigroup $\gamma$ on $\Phi(\mathcal{K})$ satisfying

$$ \gamma_t((s(f)) := s(s_t f) \quad (f \in \mathcal{H}, \ t \geq 0). $$

This is called the free flow of rank $\text{dim}(K)$. 

47
Let $\gamma$ be a free flow of any rank. It is known - see [Pop83] - that $\gamma_t(\Phi(\mathcal{K})) \cap \Phi(\mathcal{K}) = \mathbb{C}1$. So it follows from Theorem 2.2.7 that free flow is not extendable.

It is proved in [MS12] that

$$H(t) = (E^{\gamma_t} \cap E^{\gamma_t^t}) = \mathbb{C}s_t.$$ So $H = \{(t, \eta) : \eta \in H(t)\}$ is a product system. This means that free flows provide examples to show that the converse of the Corollary 2.4.6 is not true: for free flows, the family $\{(t, (E^{\gamma_t} \cap E^{\gamma_t^t}) : t \geq 0\}$ forms a product system, but still they are not extendable.
Chapter 3

CAR flows on type III factors

$E_0$-semigroups on type I factors have received much attention (see the monograph [Arv03] for an extensive list of references). The study of $E_0$-semigroups on type $II_1$ factors was initiated by Powers in 1998 (see [Pow88]). There was little progress on $E_0$-semigroups on type $II_1$ factors until the results independently obtained recently in [Ale04] and [MS12]). On the other hand, $E_0$-semigroups on type III factors have not received much attention.

In the second chapter we have attempted to study $E_0$-semigroups on arbitrary factors and studied a certain class of endomorphisms and $E_0$-semigroups which we call extendable. In the section of examples 2.5, we have already discussed CAR flows on hyperfinite type $II_1$ factor arising from the quasi-free state of $A = \frac{1}{2}$.

In this chapter we discuss CAR flows in type $III$ factors arising from the quasi-free states of $A \neq \frac{1}{2}$. We prove that CAR flows arising from some class of quasi-free states are not extendable. Also we point out an error in [ABS01]. In the last section we study the relations between CCR and CAR flows on type $III$ factors.

3.1 CAR Flow

Let $\mathcal{H} = L^2(0, \infty) \otimes \mathcal{K}$, where $\mathcal{K}$ is any Hilbert space. Let $\mathcal{F}_-(\mathcal{H})$ denote the anti-symmetric Fock space. For given $f \in \mathcal{H}$, let $a(f)$ be the creation operator in $B(\mathcal{F}_-(\mathcal{H}))$;
thus:

1. $H \ni f \mapsto a(f)$ is $\mathbb{C}$-linear,

2. (CAR) $$a(f)a(g) + a(g)a(f) = 0 \text{ and } a(f)a(g)^* + a(g)^*a(f) = \langle f, g \rangle 1,$$

where $f, g \in H$. Let $A$ be the unital $C^*$-algebra generated by $\{a(f) : f \in H\}$ in $B(F_-(H))$. We note that $||a(f)|| = ||f||$ for $f \in H$. Now suppose $R \in B(H)$ satisfies $0 \leq R \leq 1$, where of course 1 is the identity operator $id_H$. The operator $R$ determines the so-called quasi-free state $\omega_R$ on $A$ which satisfies the condition:

$$\omega_R(a^*(f_m) \cdots a^*(f_1)a(g_1) \cdots a(g_n)) = \delta_{mn}\det(\langle f_i, Rg_j \rangle).$$

It is known - see [BR81], [Amo01] - that there exists a representation $\pi_R$ of the $C^*$-algebra $A$ on the Hilbert space $H_R = F_-(H) \otimes F_-(H)$ defined by the formulae

$$\pi_R(a(f)) = a((1 - R)^{1/2}f) \otimes \Gamma + 1 \otimes a(qR^{1/2}f),$$

$$\pi_R(a^*(f)) = a^*((1 - R)^{1/2}f) \otimes \Gamma + 1 \otimes a(qR^{1/2}f),$$

$$\pi_R(1) = 1,$$

where $f \in H$. Here $\Omega$ is the ‘vacuum vector’ for the antisymmetric Fock space $F_-(H)$, $q$ is an anti-unitary operator on $H$ with $q^2 = 1$, and $\Gamma$ is the unique unitary operator on $F_-(H)$ satisfying the conditions $\Gamma a(f) = -a(f)\Gamma$, $f \in H$, and $\Gamma \Omega = \Omega$. In this representation, the state $\omega_R$ becomes the vector state

$$\omega_R(x) = \langle \Omega \otimes \Omega, \pi_R(x)\Omega \otimes \Omega \rangle,$$

for $x \in A$, and $H_R = F_-(H) \otimes F_-(H) = \overline{\pi_R(A)\Omega \otimes \Omega}$ becomes the GNS Hilbert space, under the assumption that both $R$ and $1 - R$ are injective (and hence also have dense range). So $(\pi_R, H_R, \Omega \otimes \Omega)$ is the GNS triple for the $C^*$-algebra $A$ with respect to the
state $\omega_R$. We write $M_R = \{\pi_R(A)\}''$, which is always a factor, most often of type III (see [PS70] Theorem 5.1 and Lemma 5.3).

Let $\{s_t\}_{t \geq 0}$ be the shift semigroup on $\mathcal{H}$. Assume $s_t^* R s_t = R$ for all $t \geq 0$. Then, by [Arv03] Proposition 13.2.3 and [PS70] Lemma 5.3, there exists an $E_0$-semigroup $\alpha = \{\alpha_t : t \geq 0\}$ on $M_R$, where $\alpha_t$ is uniquely determined by the following condition:

$$\alpha_t(\pi_R(a(f))) = \pi_R(a(s_t f)),$$

for all $f \in \mathcal{H}, t \geq 0$. This $E_0$-semigroup is called the CAR flow of rank $\dim \mathcal{K}$ (on $M_R$).

### 3.2 Non-Extendability of CAR flows

For the remainder of this section, we shall assume the following:

1. $qs_t = s_t q$ for all $t \geq 0$. (Such a $q$ always exists.)

2. We write $a_R(f)$ for $\pi_R(a(f))$ whenever $f \in \mathcal{H}$, and write $J$ for the modular conjugation operator of $M_R$.

3. Both $R$ and $1 - R$ are invertible; i.e., $\exists \epsilon > 0$ such that $\epsilon \leq R \leq 1 - \epsilon$.

4. $R$ is diagonalisable; in fact, there exists an orthonormal basis $\{f_i\}$ for $\mathcal{K}$ with $R f_i = \lambda_i f_i$ for some $\lambda_i \in [\epsilon, 1 - \epsilon] \setminus \{\frac{1}{2}\}$.

5. $Rs_t = s_t R \forall t \geq 0$. (Clearly then, also the Toeplitz condition $s_t^* R s_t = R$ is met.)

As we are unaware of whether, and if so where, these details may be found in the literature, we shall explicitly determine the modular operators in this case, and eventually ascertain (in Remark 3.2.6) the equi-modularity of the CAR flow.

For any (usually orthonormal)set $\{w_i\}_{i \in \mathbb{N}}$ in $\mathcal{H}$, we shall use the following notation for the rest of the paper: if $I = (i_1, i_2, \cdots, i_n)$ and $J = (j_1, j_2, \cdots, j_m)$ are ordered subsets of $\mathbb{N}$, then
1. \( w_I = w_{i_1} \land \cdots \land w_{i_n} \),
2. \( w_{IJ} = w_{i_1} \land \cdots \land w_{i_n} \land w_{j_1} \land \cdots \land w_{j_m} \),
3. \( Tw_I = Tw_{i_1} \land \cdots \land Tw_{i_n} \) for any operator \( T \in \mathcal{B}(\mathcal{H}) \);
4. \( \tilde{I} = \{ i_n, \cdots, i_1 \} \) so \( w_\tilde{I} = w_{i_n} \land \cdots \land w_{i_1} \);
5. \( a_R(w_I) = a_R(w_{i_1}) \cdots a_R(w_{i_n}) \),
6. \( a^*_R(f) = (a_R(f))^* \), so \( a^*_R(w_I) = a^*_R(w_{i_1}) \cdots a^*_R(w_{i_n}) = (a_R(w_I))^* \),

For a while, to simplify the notations, we write \( A = (1 - R)^{1/2} \), \( B = qR^{1/2} \) and notice that

\[
\langle Bh_i, Bh_j \rangle = \langle qR^{1/2}h_i, qR^{1/2}h_j \rangle \\
= \langle R^{1/2}h_j, R^{1/2}h_i \rangle \; \text{since} \; q \; \text{is anti-unitary} \\
= \langle Rh_j, h_i \rangle \\
= \delta_{i,j} \lambda_i.
\]

Lemma 3.2.1. Let \( L = \{ l_1 < \cdots < l_p \} \) be an ordered subset\(^1\) of \( \mathbb{N} \). Then we have

\[
a_R(h_L)a^*_R(h_{\tilde{L}})\Omega \otimes \Omega = \sum c(L_1)Ah_{L_1} \otimes Bh_{L_1}, \tag{3.2.1}
\]

where the summation is taken over all ordered (possibly empty) subsets \( L_1 \) of \( L \) and the \( c(L_1) \) are all non-zero real numbers - with \( Ah_q \) and \( Bh_q \) being interpreted as \( \Omega \).

Proof. We will use induction on the cardinality of \( L \). If \( |L| = 1 \), i.e \( L = \{ l \} \), then observe

---

\(^1\)For us, an ordered subset of \( \mathbb{N} \) will always mean a finite subset of \( \mathbb{N} \) with elements ordered in increasing order.
Let

\[ a_R(h_l) a_R^*(h_l) \Omega = a_R(h_l) \Omega \otimes B h_l \]

\[ = -A h_l \otimes B h_l + \|B h_l\|^2 \Omega \otimes \Omega \]

Thus our lemma is true if \(|L| = 1\). Suppose the result is true for ordered sets with \(n\) elements. Let \(l \in \mathbb{N}\) such that \(l \notin L = \{l_1 < \cdots < l_n\}\) and \(l_n < l\). Then we have,

\[
a_R(h_L) a_R(h_l) a_R^*(h_L) a_R^*(h_l) \Omega \otimes \Omega
\]

\[ = (-1)^{|L|} a_R(h_l) a_R^*(h_l) a_R(h_L) a_R^*(h_L) \Omega \otimes \Omega
\]

\[ = (-1)^{|L|} a_R(h_l) a_R^*(h_l) \sum c(L_1) A h_{L_1} \otimes B h_{L_1}
\]

\[ = (-1)^{|L|} a_R(h_l) \sum c(L_1) A h_{L_1} \otimes B h_l \wedge B h_{L_1}
\]

\[ = \sum (-1)^{|L|+|L|} c(L_1) A h_l \wedge A h_{L_1} \otimes B h_l \wedge B h_{L_1}
\]

\[ + \sum (-1)^{|L|} \lambda c(L_1) A h_{L_1} \otimes B h_{L_1}
\]

\[ = \sum (-1)^{|L|+|L|} c(L_1) A h_{L_1} \wedge A h_l \otimes B h_{L_1} \wedge B h_l
\]

\[ + \sum (-1)^{|L|} c(L_1) \lambda A h_{L_1} \otimes B h_{L_1}
\]

and the induction step is complete.

\[ \square \]

**Corollary 3.2.2.** Let \(L = \{l_1 < \cdots < l_p\}\) so that, by Lemma 3.2.1, equation 3.2.1 is satisfied. Then we have

(i) \(a_R(s_l h_L) a_R^*(s_l h_L) \Omega \otimes \Omega = \sum c(L_1) A s_l h_{L_1} \otimes B s_l h_{L_1}, \forall t \geq 0;\)

(ii) \(a_R(h_l) a_R(h_L) a_R^*(h_L) a_R^*(h_l) \Omega \otimes \Omega
\]

\[ = \sum (-1)^{|L|+|L|} c(L_1) A h_l \wedge A h_{L_1} \otimes B h_{L_1} \wedge B h_J
\]

(iii) \(a_R(s_l h_L) a_R(s_l h_L) a_R^*(s_l h_L) a_R^*(s_l h_L) \Omega \otimes \Omega
\]

\[ = \sum (-1)^{|L|+|L|} c(L_1) A s_l h_I \wedge A s_l h_{L_1} \otimes B s_l h_{L_1} \wedge B h_J, \forall t \geq 0\]
where $I$ and $J$ are finite ordered subsets of $\mathbb{N}$ with $I \cap J = I \cap L = L \cap J = \phi$, and the summation is taken over all ordered subsets $L_1$ of $L$.

Proof. 1. For the first part we use induction on cardinality of $L$. If $|L| = 1$, then $L = \{l\}$ and

$$a_R(h_l)a_R^*(h_l)\Omega \otimes \Omega = -Ah_l \otimes Bh_l + \lambda_l \Omega \otimes \Omega.$$ 

Our strong Toeplitz assumption (that $s_t$ commutes with $R$ and hence also with $A$ and $B$) then guarantees that

$$a_R(s_t h_l)a_R^*(s_t h_l)\Omega \otimes \Omega = -As_t h_l \otimes Bs_t h_l + \lambda_l \Omega \otimes \Omega$$

and part one of the corollary is true for $|L| = 1$. Suppose the result is true for ordered sets with $n$ elements. Let $l \in \mathbb{N}$ such that $l \notin L = \{l_1 < \cdots < l_n\}$ and $l_n < l$. Then the proof of Lemma 3.2.1 shows that

$$a_R(h_L)a_R(h_l)a_R^*(h_L) a_R^*(h_l) \Omega \otimes \Omega$$

$$= \sum (-1)^{|L|+1+|L_1|}c(L_1)(Ah_l \wedge Ah_{L_1} \otimes Bh_l \wedge Bh_{L_1})$$

$$+ (-1)^{|L|} \sum \lambda_l Ah_{L_1} \otimes Bh_{L_1}$$

On the other hand, arguing as in the proof of Lemma 3.2.1 and appealing to the Toeplitz condition, we observe that

$$a_R(s_t h_L)a_R(s_t h_l)a_R^*(s_t h_L) a_R^*(s_t h_l) \Omega \otimes \Omega$$

$$= \sum (-1)^{|L|+1+|L_1|}c(L_1)(As_t h_l \wedge As_t h_{L_1} \otimes Bs_t h_l \wedge Bs_t h_{L_1})$$

$$+ (-1)^{|L|} \sum \lambda_l As_t h_{L_1} \otimes Bs_t h_{L_1}.$$ 

This completes the inductive step in the proof of (i).
2. This easily follows from:

\[ a_R(h_I)a_R(h_L)a_R^*(h_J)a_R^*(h_J^-)\Omega \otimes \Omega \]

\[ = a_R(h_I)a_R^*(h_J)a_R(h_L)a_R^*(h_J^-)\Omega \otimes \Omega \]

\[ = a_R(h_I)a_R^*(h_J^-)\sum c(L_1)Ah_{L_1} \otimes Bh_{L_1} \]

\[ = a_R(h_I)\sum c(L_1)Ah_{L} \otimes Bh_{J} \wedge Bh_{L} \]

\[ = \sum c(L_1)(-1)^{|I||J||L_1|}Ah_{I} \wedge Ah_{L_1} \otimes Bh_{J} \wedge Bh_{L_1} \]

\[ = \sum c(L_1)(-1)^{|I||J||L_1|}(-1)^{|J||L_1|}Ah_{I} \wedge Ah_{L_1} \otimes Bh_{J} \wedge Bh_{L_1} \]

\[ = \sum (-1)^{|I||J||L_1|}c(L_1)Ah_{I} \wedge Ah_{L_1} \otimes Bh_{L_1} \wedge Bh_{J} \]

3. Part (iii) of the Corollary follows from part (i) of the Corollary, exactly as part (ii) of the Corollary follows from equation 3.2.1.

\[ \Box \]

Remark 3.2.3. 1. In the above corollary observe that the coefficients in the expansion of \( a_R(h_I)a_R(h_L)a_R^*(h_J)a_R^*(h_J^-)\Omega \otimes \Omega \) are symmetric in \( I \) and \( J \), that is if we interchange \( I \) and \( J \), then the corresponding coefficient will not be changed.

2. Since we have assumed that both \( R \) and \( 1 - R \) are injective (and have dense range), we may deduce from Corollary 3.2.2(ii) and the fact that every coefficient \( c(L_1) \) is non-vanishing, that \( H_R = \pi_R(A)\Omega \otimes \Omega = F_-(H) \otimes F_-(H) \).

Now the following lemma describes the action of the modular conjugation \( J \) and the commutant of \( M_R \).
Lemma 3.2.4. With the above notation,

\begin{align*}
(i) \quad & \mathcal{J}(h_I \wedge h_L \otimes qh_L \wedge qh_J) = h_{\bar{J}} \wedge h_L \otimes qh_L \wedge qh_{\bar{I}} \\
(ii) \quad & \mathcal{J} M_R \mathcal{J} = M'_R = \{ \Gamma \otimes \Gamma b_R(h_i), b_R^*(h_j)\Gamma \otimes \Gamma : i, j \in \mathbb{N} \}'' \\
(iii) \quad & \mathcal{J} a_R(h_i) \mathcal{J} = \Gamma \otimes \Gamma b_R^*(h_i)
\end{align*}

where \( b_R(h) = a(R^{1/2}h) \otimes \Gamma - 1 \otimes a^*(q(1 - R)^{1/2}h) \).

Proof. Recall the definition of the anti-linear (Tomita) operator \( S \), given by \( Sx\Omega \otimes \Omega = x^*\Omega \otimes \Omega \), \( x \in M_R \). We want to show the following expression for \( S \):

\[
S(Ah_I \wedge Ah_L \otimes Bh_L \wedge Bh_J) = Ah_{\bar{J}} \wedge Ah_L \otimes Bh_L \wedge Bh_{\bar{I}}
\]

(3.2.2)

The proof is again by induction on the cardinality of L. For \(|L| = 0\), the above assertion follows from

\[
S((1 - R)^{1/2}h_I \otimes qR^{1/2}h_J)
= Sa_R(h_I)a_R^*(h_{\bar{J}})(\Omega \otimes \Omega)
= a_R(h_{\bar{J}})a_R^*(h_I)(\Omega \otimes \Omega)
= (1 - R)^{1/2}h_{\bar{J}} \otimes qR^{1/2}h_{\bar{I}}
\]

Assume now that \(|L| = n\) and that we know the validity of equation 3.2.2 whenever \(|L| < 1\).

The point to be noticed is that Corollary 3.2.2(ii) may be re-written - in view of (i) each \( c(L_1) \) (and \( c(L) \) in particular) being non-zero, and (ii) Remark 3.2.3(i) - as:

56
\[ Ah_I \wedge Ah_L \otimes Bh_L \wedge Bh_J \]  
\[ = da_R(h_I)a_R(h_L)a_R(h_{\tilde{L}})a_R(h_{\tilde{J}})\Omega \otimes \Omega \]  
\[ + \sum_{L_1 \subseteq L} d(L_1)Ah_I \wedge Ah_{L_1} \otimes Bh_{L_1} \wedge Bh_J, \]  
where the constants \( d, d(L_1) \) are all real and remain unchanged under changing \((I, J)\) to \((\tilde{J}, \tilde{I})\).

Now apply \( S \) to both sides of the above equation. Then the two terms on the right side get replaced by the terms obtained by replacing \((I, J)\) by \((\tilde{J}, \tilde{I})\) (3.2.4 by definition of \( S \) and 3.2.5 by the induction hypothesis regarding 3.2.2), thereby completing the proof of equation 3.2.2.

Equation (3.2.2) clearly implies that

\[ S(h_I \otimes qh_J) = (R(1-R)^{-1})^{\frac{1}{2}}h_{\tilde{J}} \otimes q((R(1-R)^{-1})^{\frac{1}{2}}h_{\tilde{I}}) \]  
(3.2.6)

(even if \( I \cap J \neq \emptyset \); consideration of their intersections was needed essentially in order to establish Lemma 3.2.1 and thereby deduce the foregoing conclusions.)

Let \( D \) be the linear subspace spanned by \( \{ h_I \otimes qh_J : |I|, |J| \geq 0 \} \). Thus \( D \) is an obviously dense subspace of \( \mathcal{H}_R \) which is contained in the domain of the Tomita conjugation operator \( S \), where its action is given by equation 3.2.6. We now wish to show that \( D \) is also contained in \( \text{dom}(S^*) \) and that \( S^*|_D \) is the operator \( F \) defined by the equation

\[ F(h_I \otimes qh_J) = (R(1-R)^{-1})^{\frac{1}{2}}h_J \otimes q((1-R)^{-1})^{\frac{1}{2}}h_I \]  
(3.2.7)
Indeed, notice that

\[
\langle S(h_I \otimes qh_J, h_{I'} \otimes qh_{J'}) \rangle \\
= \langle ((1 - R)R^{-1})^{\frac{1}{2}} h_{\tilde{J}} \otimes q(R(1 - R)^{-1})^{\frac{1}{2}} h_{\tilde{J}}, h_{I'} \otimes qh_{J'} \rangle \\
= \langle ((1 - R)R^{-1})^{\frac{1}{2}} h_{\tilde{J}}, h_{I'} \rangle \langle q(R(1 - R)^{-1})^{\frac{1}{2}} h_{\tilde{J}}, qh_{J'} \rangle \\
= \langle ((1 - R)R^{-1})^{\frac{1}{2}} h_{\tilde{J}}, h_{I'} \rangle \langle h_{\tilde{J}}, (R(1 - R)^{-1})^{\frac{1}{2}} h_{I} \rangle \\
= \langle (R(1 - R)^{-1})^{\frac{1}{2}} h_{\tilde{J}}, h_{I} \rangle \langle (1 - R)R^{-1})^{\frac{1}{2}} h_{\tilde{J}}, h_{I'} \otimes qh_{J} \rangle \\
= \langle (R(1 - R)^{-1})^{\frac{1}{2}} h_{\tilde{J}}, h_{I'} \otimes qh_{J} \rangle \\
= \langle F(h_{I'} \otimes qh_{J'}), h_I \otimes qh_J \rangle
\]

Then, as $S$ and $F$ leave $\mathcal{D}$ invariant, we see that

\[
FS(h_I \otimes qh_J) \\
= F((1 - R)R^{-1})^{\frac{1}{2}} h_{\tilde{J}} \otimes q(R(1 - R)^{-1})^{\frac{1}{2}} h_{\tilde{J}} \\
= (R(1 - R)^{-1})^{\frac{1}{2}} h_{I} \otimes q(1 - R)R^{-1} h_J
\]

If $S = J\Delta^{1/2}$ is its polar decomposition, with $J$ the modular conjugation and $\Delta$ the modular operator for $M_R$, the action of $J$ and $\Delta$ on $\mathcal{D}$ are thus seen to be given by the following rules respectively:

\[
J(h_I \wedge h_L \otimes qh_L \wedge qh_J) = h_{\tilde{J}} \wedge h_L \otimes qh_L \wedge qh_{\tilde{J}}
\]

\[
J(\Omega \otimes \Omega) = \Omega \otimes \Omega = \Delta(\Omega \otimes \Omega)
\]

and
\[ \Delta(h_I \wedge h_L \otimes qh_L \wedge qh_J) \]
\[ = R(1 - R)^{-1}h_I \wedge R(1 - R)^{-1}h_L \otimes q(1 - R)R^{-1})h_L \wedge q(1 - R)R^{-1}h_J \]

This proves part (i) of the Lemma, while the proof of parts (ii) and (iii) only involve of
the following facts:

1. Lemma 3.2.1 and Corollary 3.2.2 imply that \( M_R(\Omega \otimes \Omega) \) is dense in \( \mathcal{F}_-(\mathcal{H}) \otimes \mathcal{F}_-(\mathcal{H}) \);

2. Lemma 3.2.4 (i) implies that \( \mathcal{J}(\mathcal{D}) = \mathcal{D} \)

3. A painful but not difficult case-by-case computation reveals that

\[ \mathcal{J}a_R(f)\mathcal{J} = (\Gamma \otimes \Gamma)b_R^*(f) \in M'_R \forall f \]

\[ \square \]

The fact that \( s_t \) commutes with \( R \) is seen to imply that the state \( \omega_R \) is preserved by
the CAR flow \( \{\alpha_t : t \geq 0\} \) and hence there exists a canonical semi-group \( \{S_t : t \geq 0\} \) of
isometries on \( \mathcal{H}_R \) such that

\[ S_t(x(\Omega \otimes \Omega) = \alpha_t(x)(\Omega \otimes \Omega) \forall x \in M_R. \]

The next lemma relates this semigroup \( \{S_t : t \geq 0\} \) of isometries on \( \mathcal{H}_R \) and the shift
semigroup \( \{s_t : t \geq 0\} \) of isometries on \( \mathcal{H} \).

**Lemma 3.2.5.** Let \( \{h_i\}_{i \in \mathbb{N}} \) be the orthonormal basis of \( \mathcal{H} \) as above. Then for every \( t \geq 0 \),
we have,

\[ S_t(h_L \wedge h_I \otimes qh_L \wedge qh_J) = s_t h_L \wedge s_t h_I \otimes q s_t h_L \wedge q s_t h_J, \]

where \( I, J, \) and \( L \) are ordered subsets of \( \mathbb{N} \) with \( I \cap J = I \cap L = L \cap J = \phi. \)
Proof. From the proof of the Lemma 3.2.4, we have

\[ Ah_I \land Ah_L \otimes Bh_L \land Bh_J \]
\[ = da_R(h_L)a_R(h_I)a^*_R(h_L)a^*_R(h_J)\Omega \otimes \Omega \]
\[ + \sum d_1(L_1)Ah_I \land Ah_{L_1} \otimes Bh_{L_1} \land Bh_J, \]

where \( d, d_1 \) are non-zero real numbers. Again from of the corollary 3.2.2(iii), we also have,

\[ As_Ih_I \land As_Ih_L \otimes Bs_Ih_L \land Bs_Ih_J \]
\[ = da_R(s_Ih_L)a_R(s_Ih_I)a^*_R(s_Ih_L)a^*_R(s_Ih_J)\Omega \otimes \Omega \]
\[ + \sum d_1(L_1)As_Ih_I \land As_Ih_{L_1} \otimes Bs_Ih_{L_1} \land Bh_J. \]

So finally to prove our Lemma, again we use induction on the cardinality of \( L \). For \(|L| = 0\) or \(1\), it is a easy calculation. suppose \(|L| = n\) and our Lemma is true for all ordered subset \( L_1 \) of \( L \) with \(|L_1| < |L|\). Then observe that,

\[ As_Ih_I \land As_Ih_L \otimes Bs_Ih_L \land Bs_Ih_J \]
\[ = da_R(s_Ih_L)a_R(s_Ih_I)a^*_R(s_Ih_L)a^*_R(s_Ih_J)\Omega \otimes \Omega \]
\[ + \sum d_1(L_1)As_Ih_I \land As_Ih_{L_1} \otimes Bs_Ih_{L_1} \land Bh_J. \]
\[ = S_I[da_R(h_L)a_R(h_I)a^*_R(h_L)a^*_R(h_J)\Omega \otimes \Omega, (\text{Recall } S_I)] \]
\[ + S_I(\sum d_1(L_1)Ah_I \land Ah_{L_1} \otimes Bh_{L_1} \land Bh_J) \]
\[ = S_I(\sum d_1(L_1)Ah_I \land Ah_{L_1} \otimes Bh_{L_1} \land Bh_J) \]
\[ = S_I(\sum d_1(L_1)Ah_I \land Ah_{L_1} \otimes Bh_{L_1} \land Bh_J) \]
So we have
\[ S_t(Ah_I \wedge Ah_L \otimes Bh_L \wedge Bh_J) = As_t h_I \wedge As_t h_L \otimes Bs_t h_L \wedge Bs_t h_J. \]

As we have \( s_t R = R s_t \), clearly above implies,
\[ S_t(h_L \wedge h_I \otimes qh_L \wedge qh_J) = s_t h_L \wedge s_t h_I \otimes q s_t h_L \wedge q s_t h_J, \]

\[ \square \]

**Remark 3.2.6.** Using the definition of \( S_t \) and \( J \), it easily follows that \( S_t J = J S_t \) for all \( t \geq 0 \), which implies that \( \alpha_t \) is equi-modular endomorphism for every \( t \geq 0 \). So now we are in the perfect situation to talk about the extendability of the CAR flow and under the above assumptions on \( R \), we prove that CAR flows are not extendable.

Now our aim is to explicitly determine \( (\alpha_t(M_R)' \cap M_R)(\Omega \otimes \Omega) \) for the CAR flow \( \alpha = \{\alpha_t : t \geq 0\} \).

Let \( \mathcal{P} \) and \( \mathcal{F} \) denote copies of \( \mathbb{N} \) - where we wish to think of \( \mathcal{F} \) and \( \mathcal{P} \) as signifying the future and past respectively. Let us write \( f_i = s_t h_i \), so \( \{f_j\}_{j \in \mathcal{F}} \) is an orthonormal basis for \( L^2(t, \infty) \otimes \mathcal{K} \). Also consider an orthonormal basis \( \{e_i\}_{i \in \mathcal{P}} \) of \( L^2(0, t) \otimes \mathcal{K} \). Then clearly \( \{e_i\}_{i \in \mathcal{P}} \cup \{f_j\}_{j \in \mathcal{F}} \) is an orthonormal basis for \( L^2(0, \infty) \otimes \mathcal{K} \).

Let \( F(\mathcal{F}) \) and \( F(\mathcal{P}) \) denote the collections of all finite ordered subsets of \( \mathcal{F} \) and \( \mathcal{P} \) respectively. Then \( \mathcal{L} = \{v_{I_1, I_2} \otimes qv_{J_1, J_2} : I_1, I_2 \in F(\mathcal{P}), J_1, J_2 \in F(\mathcal{F})\} \) is an orthonormal basis for \( \mathcal{F}_-(\mathcal{H}) \otimes \mathcal{F}_-(\mathcal{H}) \), where \( \nu_{I,J} = e_{i_1} \wedge e_{i_2} \wedge \ldots \wedge e_{i_n} \wedge f_{j_1} \wedge f_{j_2} \wedge \ldots \wedge f_{j_m}, \) with \( I = \{i_1 < i_2 \cdots < i_n\} \subset \mathcal{P} \) and \( J = \{j_1 < j_2 \cdots j_m \subset \mathcal{F}\} \).

Now if \( T \in \mathcal{B}(\mathcal{H}_R) \), we will be working with the expansion of \( T(\Omega \otimes \Omega) \) with respect to above orthonormal basis. Let us fix an \( l \in \mathcal{F} \). We shall write \( T(\Omega \otimes \Omega) \) in the following fashion, paying special attention to the occurrence or not of \( l \) in the first and/or second
Here and in the sequel, it will be tacitly assumed that the sums range over \(((I_1, J_1), (I_2, J_2)) \in (F(\mathcal{P}) \times F_i(\mathcal{F}))^2\) - where we write \(F_i(\mathcal{F}) = F(\mathcal{F}\setminus\{I\})\) - and \(p_{mn}, u_{mn} : \{(I_1, J_1, I_2, J_2) : I_k \in F(\mathcal{P}), J_l \in F_l(\mathcal{F})\} \to \mathbb{C}, m, n \in \{0, 1\}\) where it is demanded that \(\text{spt}(p_{00}) = \text{spt}(p_{11})\) and that \(\text{spt}(p_{11}), \text{spt}(u_{00}), \text{spt}(u_{10}), \text{spt}(u_{01})\) and \(\text{spt}(u_{11})\) are all disjoint sets - where we write \(\text{spt}(f)\) for the subset of its domain where the function \(f\) is non-zero. When necessary to show their dependence on the index \(l\), we shall anoint these functions with an appropriate superscript, as in: \(p_{11}^l(IJ, I'J')\).

The letters \(p\) and \(u\) are meant to signify ‘paired’ and ‘unpaired’. Thus, suppose \(l \in \mathcal{F}, I, L \in F(\mathcal{P}), J, K \in F_l(\mathcal{F})\). If both \(v_{IJ} \otimes q_{VLK}\) and \(f_l \wedge v_{IJ} \otimes q_{f_l} \wedge q_{VLK}\) appear in the representation of \(T(\Omega \otimes \Omega)\) with non-zero coefficients, then we shall think of \((IJ, KL)\) as being an \(l\)-paired ordered pair. Thus \(\text{spt}(p_{00}) = \text{spt}(p_{11})\) is the collection of \(l\)-paired ordered pairs, while \(\cup_{m,n=0,1} \text{spt}(u_{mn})\) is the collection of \(l\)-unpaired ordered pairs.

Note that in such an expression of \(T(\Omega \otimes \Omega)\) with respect to different \(l\), the type of a summand may change but the coefficients remain the same up to sign, since two vectors anti-commute under wedge product. We also note that \(T(\Omega \otimes \Omega)\) has been written with respect to the basis \(\mathcal{L}' = \{v_{I_1J_1} \otimes q_{I_2J_2}, f_l \wedge v_{I_1J_1} \otimes q_{I_2J_2}, v_{I_1J_1} \otimes q_{f_l} \wedge q_{I_2J_2}, f_l \wedge v_{I_1J_1} \otimes q_{f_l} \wedge q_{I_2J_2} : I_i \in F(\mathcal{P}), J_r \in F_l(\mathcal{F})\}\). There are five types of sums in the representation:

\[
T(\Omega \otimes \Omega) = \sum (p_{00}(I_1J_1, I_2J_2) \ v_{I_1J_1} \otimes q_{I_2J_2} \\
+ p_{11}(I_1J_1, I_2J_2) \ f_l \wedge v_{I_1J_1} \otimes q_{f_l} \wedge q_{I_2J_2}) \\
+ \sum u_{00}(I_1J_1, I_2J_2) \ v_{I_1J_1} \otimes q_{I_2J_2} \\
+ \sum u_{10}(I_1J_1, I_2J_2) \ f_l \wedge v_{I_1J_1} \otimes q_{I_2J_2} \\
+ \sum u_{01}(I_1J_1, I_2J_2) \ v_{I_1J_1} \otimes q_{f_l} \wedge q_{I_2J_2} \\
+ \sum u_{11}(I_1J_1, I_2J_2) \ f_l \wedge v_{I_1J_1} \otimes q_{f_l} \wedge q_{I_2J_2}.
\] (3.2.8)
of \(T(\Omega \otimes \Omega)\). For simplicity of notation, let us write:

\[
(i) \quad \xi_T(p) = \sum (p_{00}(I_1J_1, I_2J_2) \, v_{I_1J_1} \otimes q_{I_2J_2}) \\
+ p_{11}(I_1J_1, I_2J_2) \, f_l \wedge v_{I_1J_1} \otimes qf_l \wedge qv_{I_2J_2})
\]

\[
(ii) \quad \xi_T(u_{00}) = \sum u_{00}(I_1J_1, I_2J_2) \, v_{I_1J_1} \otimes qv_{I_2J_2}
\]

\[
(iii) \quad \xi_T(u_{10}) = \sum u_{10}(I_1J_1, I_2J_2) \, f_l \wedge v_{I_1J_1} \otimes qv_{I_2J_2}
\]

\[
(iv) \quad \xi_T(u_{01}) = \sum u_{01}(I_1J_1, I_2J_2) \, v_{I_1J_1} \otimes qf_l \wedge qv_{I_2J_2}
\]

\[
(v) \quad \xi_T(u_{11}) = \sum u_{11}(I_1J_1, I_2J_2) \, f_l \wedge v_{I_1J_1} \otimes qf_l \wedge qv_{I_2J_2},
\]

and \(S = \{p, u_{00}, u_{10}, u_{01}, u_{11}\}\). So we have:

\[
T(\Omega \otimes \Omega) = \sum_{x \in S} \xi_T(x).
\]

We also write:

\[
(i) \quad A_1 = \frac{1}{(1 - \lambda_l)^{1/2}} a_R(f_l), \\
(ii) \quad A_2 = -\frac{1}{\lambda_l^{1/2}} \Gamma \otimes \Gamma b_R(f_l) \\
(iii) \quad B_1 = \frac{1}{\lambda_l^{1/2}} a^*_R(f_l), \\
(iv) \quad B_2 = -\frac{1}{(1 - \lambda_l)^{1/2}} b^*_R(f_l)(\Gamma \otimes \Gamma)
\]

There is an implicit dependence in the definition of the \(A_i\)'s and \(B_i\)'s of the preceding equations on the arbitrarily chosen \(l \in \mathcal{F}\). When we wish to make this dependence explicit (as in Theorem 3.2.7 below), we shall adopt the following notational device: \(A_l = \{A_1, A_2\}\) and \(B_l = \{B_1, B_2\}\). We shall frequently use the following facts in the sequel:

1. \(R^{1/2}f_l = R^{1/2}s_l h_l = \lambda_l^{1/2} f_l\)
2. \((1 - R)^{1/2} f_l = (1 - R)^{1/2} s_l h_l = (1 - \lambda_l)^{1/2} f_l\); and

3. \(f_l \otimes \Omega, \Omega \otimes f_l \in \text{ran}(S_l) \ \forall \ l \in \mathcal{F} \).

**Theorem 3.2.7.** If \(T \in \mathcal{B}(\mathcal{H}_R)\) satisfies \(A_1 T(\Omega \otimes \Omega) = A_2 T(\Omega \otimes \Omega)\) and \(B_1 T(\Omega \otimes \Omega) = B_2 T(\Omega \otimes \Omega)\) for \(A_1, A_2 \in \mathcal{A}_l, B_1, B_2 \in \mathcal{B}_l\) and for all \(l \in \mathcal{F}\), then

\[
T(\Omega \otimes \Omega) \subset \{[v_{I_1} \otimes q v_{I_2} : I_1, I_2 \in F(\mathcal{P}), (-1)^{|I_1|} = (-1)^{|I_2|}] \},
\]

where \([\ ]\) denotes span closure.

We start with a \(T \in \mathcal{B}(\mathcal{H}_R)\), which satisfies the hypothesis of the above Theorem 3.2.7 and write \(T(\Omega \otimes \Omega)\) as in 3.2.8, for an arbitrary choice of index \(l\). Then we go through the following Lemmas and prove that the coefficient functions \(p_{00}, p_{11}, u_{10}, u_{01}, u_{11}\) are identically zero, while the support of \(u_{00}\) is contained in the set \(\{(I_1, I_1, I_2) : I_1 \cup I_2 = \emptyset, (-1)^{|I_1|} = (-1)^{|I_2|}\}\). The truth of this assertion for all choices of \(l\) will prove our Theorem 3.2.7. We start with a Lemma regarding the representation of \(T(\Omega \otimes \Omega)\).

**Lemma 3.2.8.** Let \(\eta(x)\) (resp., \(\eta(y)\)) be a summand\(^2\) of the sum \(\xi_T(x)\) (resp, \(\eta(y)\)), where \(x, y \in \mathcal{S}\). Then \(\langle \eta(x), \eta(y) \rangle = 0\) implies that \(\langle X \eta(x), Y \eta(y) \rangle = 0\), for all \(x, y \in \mathcal{S}\) and \(X, Y \in \mathcal{A}\) or \(X, Y \in \mathcal{B}\).

**Proof.** This follows from (i) the assumptions that \(spt(p_{00}) = spt(p_{11})\), (ii) \(sp(p_{11})\), \(spt(u_{00}), spt(u_{10})\), \(spt(u_{01})\) and \(spt(u_{11})\) are all disjoint sets and (iii) the definition of the action of \(X, Y\) on \(\eta(x)\). \(\square\)

**Lemma 3.2.9.** If \(A_1 T(\Omega \otimes \Omega) = A_2 T(\Omega \otimes \Omega)\), then \(A_1 \xi_T(x) = A_2 \xi_T(x)\) for all \(x \in \mathcal{S}\).

Similarly if \(B_1 T(\Omega \otimes \Omega) = B_2 T(\Omega \otimes \Omega)\), then \(B_1 \xi_T(x) = B_2 \xi_T(x)\) for all \(x \in \mathcal{S}\).

**Proof.** This follows from

\[
\| (A_1 - A_2) T(\Omega \otimes \Omega) \|^2 = \sum_{x \in \mathcal{S}} \| (A_1 - A_2) \xi_T(x) \|^2,
\]

\(^2\)By a summand of \(\xi_T(x)\) we shall mean a ‘paired term’ of the form \((p_{00}(I_1, J_1, I_2, J_2) v_{I_1, I_1} \otimes q v_{I_2, J_2} + p_{11}(I_1, J_1, I_2, J_2) f_I \otimes v_{I_1, J_1} \otimes q f_I \otimes q v_{I_2, J_2})\) rather than an individual term of such a pair.
which is a consequence of Lemma 3.2.8.

Now onwards we assume that $T$ satisfies the hypothesis of the Theorem 3.2.7 and with the foregoing notations we have the following Lemma regarding the coefficients of the representation of $T(\Omega \otimes \Omega)$.

**Lemma 3.2.10.** $p_{00}$, $p_{11}$, $u_{00}$, $u_{10}$, $u_{01}$, $u_{11}$ satisfy the following equations:

\[(i) \quad \sigma(I_2, J_2)p_{00}(I_1 J_1, I_2 J_2) + p_{11}(I_1 J_1, I_2 J_2) \frac{\lambda_i^{1/2}}{(1 - \lambda_i)^{1/2}} = \sigma(I_1, J_1)p_{00}(I_1 J_1, I_2 J_2) + \rho(I_1 J_1, I_2 J_2)p_{11}(I_1 J_1, I_2 J_2) \frac{(1 - \lambda_i)^{1/2}}{\lambda_i^{1/2}},\]

\[(ii) \quad \sigma(I_2, J_2)u_{00}(I_1 J_1, I_2 J_2) = \sigma(I_1, J_1)u_{00}(I_1 J_1, I_2 J_2),\]

\[(iii) \quad u_{01}(I_1 J_1, I_2 J_2) \frac{\lambda_i^{1/2}}{(1 - \lambda_i)^{1/2}} = *u_{01}(I_1 J_1, I_2 J_2) \frac{(1 - \lambda_i)^{1/2}}{\lambda_i^{1/2}},\]

\[(iv) \quad *u_{11}(I_1 J_1, I_2 J_2) \frac{\lambda_i^{1/2}}{(1 - \lambda_i)^{1/2}} = *u_{11}(I_1 J_1, I_2 J_2) \frac{(1 - \lambda_i)^{1/2}}{\lambda_i^{1/2}},\]

\[(v) \quad *\left(1 - \lambda_i\right)^{1/2} u_{10}(I_1 J_1, I_2 J_2) = *\left(1 - \lambda_i\right)^{1/2} u_{10}(I_1 J_1, I_2 J_2)\]

where $\sigma : F(\mathcal{P}) \times F(\mathcal{F}) \to \{1, -1\}$ is defined by $\sigma(I, J) = (-1)^{|I|+|J|}$, $\rho : \{(I_1 J_1, I_2 J_2) : I_k \in F(\mathcal{P}), J_l \in F(\mathcal{F})\} \to \{1, -1\}$, defined by $\rho(I_1 J_1, I_2 J_2) = (-1)^{|I_1|+|J_1|+|I_2|+|J_2|}$, and $* = \pm 1$.

**Proof.** $T$ satisfies $A_1(T\Omega \otimes \Omega) = A_2(T\Omega \otimes \Omega)$. So from the Lemma 3.2.9, we have $A_1\xi_T(x) = A_2\xi_T(x)$ for $x \in S$. Now for every $x \in S$, we separately compute $A_1\xi_T(x)$ and $A_2\xi_T(x)$ and compare their coefficients.
(i) If $A_1 \xi_T(p) = A_2 \xi_T(p)$, observe that

\[
A_1 \xi_T(p) = \frac{1}{(1 - \lambda_t)^{1/2}} a_R(f_l) \xi_T(p)
\]

\[
= \sum (p_{00}(I_1, J_1, I_2, J_2) \frac{1}{(1 - \lambda_t)^{1/2}} a_R(f_l) v_{I_1, J_1} \otimes q v_{I_2, J_2} + p_{11}(I_1, J_1, I_2, J_2) \frac{1}{(1 - \lambda_t)^{1/2}} a_R(f_l) f_l \wedge v_{I_1, J_1} \otimes q f_l \wedge q v_{I_2, J_2})
\]

\[
= \sum (\sigma(I_1, J_1) p_{00}(I_1, J_1, I_2, J_2) + p_{11}(I_1, J_1, I_2, J_2) \frac{(1 - \lambda_t)^{1/2}}{(1 - \lambda_t)^{1/2}} f_l \wedge v_{I_1, J_1} \otimes q v_{I_2, J_2})
\]

while

\[
A_2 \xi_T(p)
\]

\[
= \frac{-1}{\lambda_t^{1/2}} \Gamma \otimes \Gamma b(f_l) \xi_T(p)
\]

\[
= \sum (p_{00}(I_1, J_1, I_2, J_2) \frac{-1}{\lambda_t^{1/2}} \Gamma \otimes \Gamma b(f_l) v_{I_1, J_1} \otimes q v_{I_2, J_2} + p_{11}(I_1, J_1, I_2, J_2) \frac{-1}{\lambda_t^{1/2}} \Gamma \otimes \Gamma b(f_l) f_l \wedge v_{I_1, J_1} \otimes q f_l \wedge q v_{I_2, J_2})
\]

\[
= \sum (\sigma(I_1, J_1) p_{00}(I_1, J_1, I_2, J_2) + p(I_1, J_1, I_2, J_2) p_{11}(I_1, J_1, I_2, J_2) \frac{(1 - \lambda_t)^{1/2}}{(1 - \lambda_t)^{1/2}} f_l \wedge v_{I_1, J_1} \otimes q v_{I_2, J_2})
\]

and (i) follows upon comparing coefficients in the two equations above.
(ii) If $A_1 \xi_T(u_{00}) = A_2 \xi_T(u_{00})$, observe that

\[
A_1 \xi_T(u_{00}) = \frac{1}{(1 - \lambda_i)^{1/2}} a_R(f_i) \xi_T(u_{00}) \\
= \sum u_{00}(I_1J_1, I_2J_2) (1 - \lambda_i)^{1/2} a_R(f_i) v_{I_1J_1} \otimes q_{I_2J_2} \\
= \sum \sigma(I_2, J_2) u_{00}(I_1J_1, I_2J_2) f_1 \wedge v_{I_1J_1} \otimes q_{I_2J_2}
\]

while

\[
A_2 \xi_T(u_{00}) = \frac{-1}{\lambda_i^{1/2}} \Gamma \otimes \Gamma b(f_i) \xi_T(u_{00}) \\
= \sum u_{00}(I_1J_1, I_2J_2) \frac{-1}{\lambda_i^{1/2}} \Gamma \otimes \Gamma b(f_i) v_{I_1J_1} \otimes q_{I_2J_2} \\
= \sum \sigma(I_1, J_1) u_{00}(I_1J_1, I_2J_2) f_1 \wedge v_{I_1J_1} \otimes q_{I_2J_2}.
\]

and (ii) follows upon comparing coefficients in the two equations above.

Equations (iii) and (iv) are proved by arguing exactly as for (ii) above.

As for (v), we also have $B_1 T(\Omega \otimes \Omega) = B_2 T(\Omega \otimes \Omega)$. So from Lemma 3.2.9, we have $B_1 \xi_T(x) = B_2 \xi_T(x)$ for all $x \in S$. In particular we have $B_1 \xi_T(u_{10}) = B_2 \xi_T(u_{10})$ We compute $B_1 \xi_T(u_{10})$ and $B_2 \xi_T(u_{10})$:

\[
B_1 \xi_T(u_{10}) \\
= \frac{1}{\lambda_i^{1/2}} a_R^*(f_i) \sum u_{10}(I_1J_1, I_2J_2) f_1 \wedge v_{I_1J_1} \otimes q_{I_2J_2} \\
= \sum(\ast \frac{(1 - \lambda_i)^{1/2}}{\lambda_i^{1/2}} u_{10}(I_1J_1, I_2J_2) v_{I_1J_1} \otimes q_{I_2J_2} + v_{I_1J_1} \otimes q f_1 \wedge q_{I_2J_2})
\]

67
while

\[ B_2 \xi_T(u_{10}) = \frac{-1}{(1 - \lambda_l)^{1/2}} b^*_R(f_1)(\Gamma \otimes \Gamma) \sum u_{10}(I_1 J_1, I_2 J_2) f_I \wedge v_{I_1 J_1} \otimes q v_{I_2 J_2} \]

\[ = \sum (\star \frac{\lambda_l^{1/2}}{(1 - \lambda_l)^{1/2}} u_{10}(I_1 J_1, I_2 J_2) v_{I_1 J_1} \otimes q v_{I_2 J_2} + \star v_{I_1 J_1} \otimes q f_I \wedge q v_{I_2 J_2}) \]

where \( \star \in \{+, -\} \). So by comparing coefficients in the expansion of \( B_1 \xi_T(u_{10}) \) and \( B_2 \xi_T(u_{10}) \), we find equation (v) of Lemma 3.2.10.

With foregoing notation and the assumptions on \( T \), we have the following Corollary.

**Corollary 3.2.11.** If we represent \( T(\Omega \otimes \Omega) \) las in eqn. 3.2.8, then

\[ u_{01} = u_{11} = u_{10} = 0. \]

That is the functions \( u_{01}, u_{11} \) and \( u_{10} \) are identically zero.

**Proof.** This is an immediate consequence of Lemma 3.2.10(iii), 3.2.10(iv) and 3.2.10(v) and the assumption that \( \lambda_l \neq 1/2 \forall l. \) \( \square \)

We continue to assume that an operator \( T \in \mathcal{B}(\mathcal{H}_R) \) satisfies the hypothesis of the Theorem 3.2.7 and proceed to analyse the representation of \( T(\Omega \otimes \Omega) \) as in eqn. (3.2.8).

**Remark 3.2.12.**

1. **Lemma 3.2.10(i)** implies that if \( (I J, K L) \) are l-paired, then \( \sigma(I, J) \neq \sigma(K, L) \). (Reason: Otherwise, since \( \rho(IJ, KL) = \pm 1 \), and \( |p_{11}(IJ, KL)| \neq 0 \), we must have \( \lambda_l = \frac{1}{2} \).)

2. **Lemma 3.2.10(ii)** implies that if \( u_{00}(I_1 J_1, I_2 J_2) \neq 0 \), then \( \sigma(I_2, J_2) = \sigma(I_1, J_1) \), i.e. \( (-1)^{|I_1| + |J_1|} = (-1)^{|I_2| + |J_2|} \).

Now we wish to compare the representations of \( T(\Omega \otimes \Omega) \) for different \( l \)'s.
Lemma 3.2.13. Let $I, K \in F(P)$ and $J, L \in F(F)$. If a term of the form $v_{IJ} \otimes qv_{KL}$ appears in $T(\Omega \otimes \Omega)$ with non-zero coefficient, then $(IJ, KL)$ can be $w$-paired for at most finitely many $w \in F$ with $w \notin J \cup L$.

Proof. Suppose, if possible, that $\{l_n : n \in F\}$ is an infinite sequence of distinct indices such that $(IJ, KL)$ is $l_n$-paired for each $n \in \mathbb{N}$. Then we may, by Remark 3.2.12(1), conclude that $\{\sigma(I, J), \sigma(K, L)\} = \{1, -1\}$.

Deduce now from Lemma 3.2.10(i) that

$$\sigma(K, L)p_{00}(IJ, LK) + *p_{11}^l(IJ, KL)\frac{\lambda_n^{1/2}}{(1 - \lambda_n)^{1/2}}$$

$$= \sigma(I, J)p_{00}(IJ, LK) + *p_{11}^l(IJ, KL)\frac{(1 - \lambda_n)^{1/2}}{\lambda_n^{1/2}}$$

(3.2.9)

where $* \in \{+,-\}$. Since $\lambda_n \in (\epsilon, 1 - \epsilon) \setminus \{1/2\}$ for all $n$, we see that $\{\frac{\lambda_n^{1/2}}{(1 - \lambda_n)^{1/2}} : n \in \mathbb{N}\}$ and $\{\frac{(1 - \lambda_n)^{1/2}}{\lambda_n^{1/2}} : n \in \mathbb{N}\}$ are bounded sequences. As $p_{11}^l(IJ, KL)$ are Fourier coefficients, the sequence $\{p_{11}^l(IJ, KL)\}$ converges to 0, as $n \to \infty$. Clearly then $\{\frac{\lambda_n^{1/2}}{(1 - \lambda_n)^{1/2}}p_{11}^l(IJ, KL) : n \in \mathbb{N}\}$ and $\{\frac{(1 - \lambda_n)^{1/2}}{\lambda_n^{1/2}}p_{11}^l(IJ, KL) : n \in \mathbb{N}\}$ are sequences converges to 0, as $n \to \infty$. So from the above equation we get $p_{00}(IJ, LK) = 0$. But we had assumed that $p_{00}(IJ, LK)$ is non-zero. Hence $v_{IJ} \otimes qv_{KL}$ can not be $l$-paired for infinitely many $l \in F$ with $l \notin J \cup L$.

□

Lemma 3.2.14. Let $I, K \in F(P)$ and $J, L \in F(F)$ with $l \notin J \cup L$. Suppose an element of the form $v_{IJ} \otimes qv_{KL}$, appearing in $T(\Omega \otimes \Omega)$ with a non-zero coefficient. Then we have

$$(−1)^{|I|+|J|} = (−1)^{|K|+|L|}.$$ 

Proof. From Lemma 3.2.13, we can find a $l_0 \in F$ such that $l_0 \notin J \cup L$ and $v_{IJ} \otimes qv_{KL}$ is not $l_0$-paired. If we write $T(\Omega \otimes \Omega)$ with respect to $l_0$, we see that $v_{IJ} \otimes qv_{KL}$ appears with exactly the same coefficient as in the third type of sum. So by observing the Remark 3.2.12 with respect to $l_0$, see that $(-1)^{|I|+|J|} = (-1)^{|K|+|L|}$.

□

Again with the foregoing notations, we have the following Lemma about the coefficients of the representation of $T(\Omega \otimes \Omega)$.
Lemma 3.2.15. \( p_{00} = p_{11} = 0 \).

Proof. Recall the equation 3.2.10(i) from Lemma 3.2.10:

\[
\sigma(I_2, J_2)p_{00}(I_1J_1, I_2J_2) + p_{11}(I_1J_1, I_2J_2) \frac{\lambda_l^{1/2}}{(1-\lambda_l)^{1/2}} = \sigma(I_1, J_1)p_{00}(I_1J_1, I_2J_2) + \rho(I_1J_1, I_2J_2)p_{11}(I_1J_1, I_2J_2) \frac{(1-\lambda_l)^{1/2}}{\lambda_l^{1/2}}
\]

where \( \sigma(I_2, J_2) = (-1)^{|I_2|+|J_2|} \) and \( \sigma(I_1, J_1) = (-1)^{|I_1|+|J_1|} \). But from 3.2.14 we have \((-1)^{|I_2|+|J_2|} = (-1)^{|I_1|+|J_1|}\). Since \( \lambda_l \neq 1/2 \), from the above equation we get \( p_{11}(I_1J_1, I_2J_2) = 0 \), which implies that \( p_{00}(I_1J_1, I_2J_2) = 0 \), since \( spt(P_{00}) = spt(p_{11}) \), i.e. they have the same support. \( \square \)

Lemma 3.2.16. \( T\Omega \otimes \Omega = \sum x(I_1I_2) v_{I_1} \otimes qv_{I_2} \), where the summation is taken over \( I_1, I_2 \in F(\mathcal{P}) \) with \((-1)^{|I_1|} = (-1)^{|I_2|}\).

Proof. So we started with a representation of \( T\Omega \otimes \Omega \) like 3.2.8 and by using the Corollary 3.2.11 and Lemma 3.2.15 ended up with the following conclusions:

\[
p_{00} = p_{11} = u_{10} = u_{01} = u_{11} = 0.
\]

Thus finally the representation of \( T\Omega \otimes \Omega \) will be of the form

\[
T(\Omega \otimes \Omega) = \sum u_{00}(I_1J_1, I_2J_2) v_{I_1J_1} \otimes qv_{I_2J_2},
\]

where the summation is taken over \( I_1, I_2 \in F(\mathcal{P}) \), \( J_1, J_2 \in F(\mathcal{F}) \) with \((-1)^{|I_2|+|J_2|} = (-1)^{|I_1|+|J_1|} \) and \( l \notin J_1 \cup J_2 \), for \( l \in \mathcal{F} \). Since this is true for all \( l \in \mathcal{F} \), \( J_1, J_2 \) are empty sets, i.e.

\[
T(\Omega \otimes \Omega) = \sum x(I_1, I_2) v_{I_1} \otimes qv_{I_2},
\]

where the summation is taken over \( I_1, I_2 \in F(\mathcal{P}) \) with \((-1)^{|I_1|} = (-1)^{|I_2|} \) and \( x(I_1, I_2) = u_{00}(I_1\emptyset, I_2\emptyset) \) are complex numbers. \( \square \)
So finally the above Lemma 3.2.16 proves our theorem 3.2.7.

**Theorem 3.2.17.** Let $T \in \alpha_t(M_R)' \cap M_R$, then

$$T(\Omega \otimes \Omega) \subset \{v_{I_1} \otimes qv_{I_2} : I_1, I_2 \in F(\mathcal{P}), (-1)^{|I_1|} = (-1)^{|I_2|}\},$$

**Proof.** It is enough to prove that $A_1T(\Omega \otimes \Omega) = A_2T(\Omega \otimes \Omega)$ and $B_1T(\Omega \otimes \Omega) = B_2T(\Omega \otimes \Omega)$, then it follows from the Theorem 3.2.17.

Observe that,

\[
A_1T(\Omega \otimes \Omega) = \frac{1}{(1 - \lambda_l)^{1/2}} a_R(f_l) T \Omega \otimes \Omega
\]

\[
= \frac{1}{(1 - \lambda_l)^{1/2}} Ta_R(f_l) \Omega \otimes \Omega \quad \text{since } T \in \alpha_t(M_R)'
\]

\[
= Tf_l \otimes \Omega
\]

\[
= \frac{-1}{\lambda_l^{1/2}} TT \otimes \Gamma b_R(f_l) \Omega \otimes \Omega
\]

\[
= \frac{-1}{\lambda_l^{1/2}} \Gamma \otimes \Gamma b_R(f_l) T \Omega \otimes \Omega \quad \text{since } T \in M_R \text{ and } \Gamma \otimes \Gamma b_R(f_l) \in M'_R
\]

\[
= A_2T(\Omega \otimes \Omega).
\]
So we have $A_1 T(\Omega \otimes \Omega) = A_2 T(\Omega \otimes \Omega)$. Again observe that,

\[
B_1 T(\Omega \otimes \Omega) = \frac{1}{\lambda t^{1/2}} a^*_R(f_i) T \Omega \otimes \Omega
\]

\[
= \frac{1}{\lambda t} T a^*_R(f_i) \Omega \otimes \Omega \quad \text{since } T \in \alpha_t(M_R)'
\]

\[
= T \Omega \otimes f_i
\]

\[
= \frac{-1}{(1 - \lambda t)^{1/2}} b^*_R(f_i) \Gamma \otimes \Gamma T \Omega \otimes \Omega, \quad \text{since } T \in M_R \text{ and } b^*_R(f_i) \Gamma \otimes \Gamma \in M_R'
\]

\[
= B_2 T(\Omega \otimes \Omega).
\]

That is $B_1 T(\Omega \otimes \Omega) = B_2 T(\Omega \otimes \Omega)$.

\[\square\]

**Theorem 3.2.18.** CAR flow $\alpha = \{\alpha_t : t \geq 0\}$ is not extendable.

**Proof.** It is enough to show that for some $t > 0$, $\alpha_t : M_R \mapsto M_R$ is not extendable. To prove $\alpha_t$ is not extendable, we use the Theorem 2.2.7. We observe that

\[
[y_{\alpha_t(x)} \Omega \otimes \Omega : x \in M_R, y \in \alpha_t(M_R)'] = [(a_R(f_J)a^*_R(f_L))^* T \Omega \otimes \Omega : J, L \in F(\mathcal{F}), T \in \alpha_t(M_R)']
\]

Now if $T \in \alpha_t(M_R)^{'} \cap M_R$, then from the Theorem 3.2.17 we have, $T(\Omega \otimes \Omega) \in \{v_{I_1} \otimes q v_{I_2} : I_1, I_2 \in F(\mathcal{P}), (-1)^{|I_1|} = (-1)^{|I_2|}\}$. If $g \in \mathcal{P}$, we notice that

\[
\langle (a_R(f_J)a^*_R(f_L))^* T \Omega \otimes \Omega, e_g \otimes \Omega \rangle = \langle T \Omega \otimes \Omega, a_R(f_J)a^*_R(f_L)e_g \otimes \Omega \rangle = 0.
\]
So from the above, we conclude that \( \{ y\alpha_t(x)\Omega \otimes \Omega : x \in M_R, y \in \alpha_t(M_R)' \cap M_R \} \) is orthogonal to the vector \( e_g \otimes \Omega \), i.e. \( \{ y\alpha_t(x) : x \in M_R, y \in \alpha_t(M_R)' \cap M_R \} \) can not be weakly total in \( M_R \), so by the Theorem 2.2.7 \( \alpha_t \) can not be extendable.

\[ \Box \]

**Remark 3.2.19.** It has been proved in section 5 [ABS01] that CAR flows, arising from quasi-free states for scalars \( \neq \frac{1}{2} \), on type III factors, are extendable. But we have shown that CAR arising from quasi-free states for diagonalisable positive contractions (in particular scalars) are not extendable. So our result shows that there is some error in section 5 [ABS01] regarding the conclusion of extendability of CAR flows. In-fact we think that there is a mistake in the theorem 4 of section 5 [ABS01] and for that their conclusion regarding the extendability of CAR flows went wrong.

### 3.3 CCR and CAR flows

We have already described CAR flows on type III factors. Recall the CCR algebra and its GNS representation with respect to quasi-free states from the section of examples 2.5.

We recall the von Neumann algebra \( M_A = \{ \pi(W(f)) : f \in \mathcal{H}_C \}' \).

Let \( \{ s_t \}_{t \geq 0} \) be the shift semigroup on \( \mathcal{H}_C \) and suppose that \( A \) commutes with \( s_t \) for all \( t \geq 0 \). Then \( M_A \) is a type III factor (see [Hol71]) and the CCR flow [Arv03] restricts to an \( E_0 \)-semigroup on \( M_A \), \( \beta_A = \{ \beta^A_t : t \geq 0 \} \) uniquely determined by the following condition:

\[
\beta^A_t(\pi(W(f))) = \pi(W(s_tf)),
\]

for all \( f \in \mathcal{H}_C, t \geq 0 \). This \( E_0 \)-semigroup is called **CCR flow of rank dim \( \mathcal{K} \)**.

Note that if \( A = \frac{1+\lambda}{1-\lambda} \) with \( \lambda \in (0,1) \), then it is well-known that \( M_\lambda = M_A \) is a type III \( \lambda \) factor. Further, we have also mentioned in the section of examples 2.5 that \( \{ \beta^A_t : t \geq 0 \} \) is equi-modular and all these \( E_0 \)-semigroups on type III \( \lambda \) factors are extendable.

**Remark 3.3.1.** Type III factors arising from quasi-free representations of CCR and
CAR algebras with respect to the quasi-free states are always hyperfinite (see [AW69]). In the case of CAR algebra we note that if $A = \lambda \in (0, 1) \setminus \{\frac{1}{2}\}$ then $M_A = M_\lambda$ is type $\text{III}_\lambda$ factor. So in both the case we find the hyperfinite $\text{III}_\lambda$ factor for $\lambda \in (0, 1) \setminus \{\frac{1}{2}\}$. Since the hyperfinite $\text{III}_\lambda$ factor is unique for every $\lambda \in (0, 1) \setminus \{\frac{1}{2}\}$, we thus have two families of $E_0$-semigroups namely CAR flows and CCR flows on the hyperfinite type $\text{III}_\lambda$ factor.

Now we have the following Corollary to the Theorem 3.2.18 regarding the cocycle conjugacy of CAR flows and CCR flows.

**Corollary 3.3.2.** The CAR and CCR flows arising from quasi-free states are not cocycle conjugate.

**Proof.** Srinivasan and Margetts have proved in [MS12] that CCR flows arising from these quasi-free states are extendable. By Theorem 3.2.18, CAR flows arising from quasi-free states are not extendable. But extendability of $E_0$-semigroup is a cocycle conjugacy invariant, so the result follows. \qed

**Remark 3.3.3.** This result is surprising, since on the type I factor CCR and CAR flows of the same Arveson index are cocycle conjugate ([Arv03]).
