Introduction

Logarithmic Corrections for Extremal Black Holes

Shailesh Lal

A Primer or Gaussian Integration

The Heat Kernel and Log Terms

The Heat Kernel on Conical Spaces

Zero Mode Contribution

Log Terms for $\mathcal{N} = 2, 4, 8$ Supergravity

The Twisted QEF

Conclusions

• Black Holes in a quantum theory of gravitation are expected to have entropy.

$$S_{BH} = \frac{A}{4}$$

- The Area Law is a powerful constraint on quantum gravity.
- A universal result which any microscopic interpretation must reproduce.
- Question: Can we sharpen this constraint?
- In particular, compute quantum corrections to S_{BH} from low–energy physics?

Shailesh Lal

A Primer or Gaussian Integration

The Heat Kernel and Log Terms

The Heat Kernel on Conical Spaces

Zero Mode Contribution

Log Terms for $\mathcal{N} = 2, 4, 8$ Supergravity

The Twisted QEF

Conclusions

Quantum Entropy Function

- Consider the string path integral in the NHG AdS₂ ⊗ M of an extremal BH.
- This is divergent due to the infinite volume of AdS₂.

$$\mathcal{Z}_{AdS_2}^{\text{string}} \simeq e^{C \cdot L + \mathcal{O}(L^{-1})} \mathcal{Z}_{\text{finite}}, \quad L \simeq e^{\eta_0}$$

• Then the proposal is that

$$d(Q, P) = \mathcal{Z}_{finite}$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ●□

• $\mathcal{Z}_{\text{finite}}$ is known as the Quantum Entropy Function (QEF).

Refs: A. Sen, N. Banerjee, S. Banerjee, R.K. Gupta, I. Mandal, D. Jatkar (2008-)

Zero Mode Contribution

Log Terms for $\mathcal{N} = 2, 4, 8$ Supergravity

The Twisted QEF

Conclusions

Quantum Entropy Function

Given this proposal, three avenues are open to us

- Match the QEF answer against the string answer where available, $(\mathcal{N}=4,\mathcal{N}=8)$
- Evaluate for EBHs where string answer unknown, $(\mathcal{N}=2)$
- Extend the QEF proposal to learn more about EBH microstates. (twisted indices)

In this talk we will perform computations related to all of the above motivations.

Shailesh Lal

A Primer or Gaussian Integration

The Heat Kernel and Log Terms

The Heat Kernel on Conical Spaces

Zero Mode Contribution

Log Terms for $\mathcal{N} = 2, 4, 8$ Supergravity

The Twisted QEF

Conclusions

BH Entropy from String Theory

• String Theory computes Black Hole Entropy in the form of a microscopic degeneracy

$$d(Q,P) \simeq (A)^m e^{\frac{A}{4}} + \sum_N (A)^p e^{\frac{A}{4N}}; \quad A \equiv A(Q,P)$$

• Taking the logarithm of the degeneracy

$$S_{BH} = \ln \left(d_{micro}
ight) \simeq rac{A}{4} + m \ln rac{A}{4}$$

イロト 不得 トイヨト イヨト

э

• How do we recover this from the QEF?

Log Terms fo $\mathcal{N} = 2, 4, 8$ Supergravity

The Twisted QEF

Conclusions

Introduction

- We evaluate $\mathcal{Z}_{\text{finite}}$ in a saddle–point approximation.
- One saddle-point of the QEF is the near-horizon geometry of the black hole itself.
- Evaluating $\mathcal{Z}_{\text{finite}}$ at this saddle–point produces

 $S_{BH} = \ln d \left(Q, P \right) = \ln \mathcal{Z}_{\text{finite}} = \frac{A}{4}$

- Which is the Bekenstein-Hawking formula.
- How do we reproduce the Log term?

$$\delta S \simeq \ln \frac{A}{4}$$

• We do a loop expansion about this saddle-point.

Logarithmic Corrections for Extremal Black Holes

Shailesh Lal

- A Primer on Gaussian Integration
- The Heat Kernel and Log Terms
- The Heat Kernel on Conical Spaces
- Zero Mode Contribution
- Log Terms fo $\mathcal{N} = 2, 4, 8$ Supergravity
- The Twisted QEF
- Conclusions

- Naively, this sounds prohibitive! Infinite number of fields, what order in loop expansion?
- It turns out that the log terms are simple to reproduce!
- The only contribution to the log term comes from
 - massless fields of supergravity,
 - only one-loop fluctuations,
 - Two derivative sector of the action is sufficient.
- The log term can be thought of as a quantum counterpart of the leading Bekenstein–Hawking answer, determined purely from low–energy physics of the black hole.

Log Terms fo $\mathcal{N} = 2, 4, 8$ Supergravity

The Twisted QEF

Conclusions

The string theory answer for d(Q, P) takes the form

$$d\left(Q,P
ight)\sim e^{rac{A}{4}}+\sum_{N}e^{rac{A}{4N}}$$

Question: What is the origin of these terms in the QEF? Proposal: sum over all spacetimes \sim black hole NHG. \mathbb{Z}_N orbifolds are natural candidates.

- They are admissible saddle-points of the QEF.
- At the saddle-point $\mathcal{Z}_{finite} = e^{\frac{A}{4N}}$.
- explain exponentially suppressed corrections to d(Q, P)?
- Test: match the log term!

Gaussian Integrals

(日)、

э

Consider a Gaussian Integral over a matrix $M_{ij} = \kappa_i \delta_{ij}$.

$$Z = \int \left(\prod_{i=1}^n dx_i e^{-\kappa_i x_i^2}\right) = \sqrt{\frac{1}{\prod_{i=1}^n \kappa_i}} = \det^{-\frac{1}{2}} M.$$

- This is true only if $\kappa_i > 0 \forall i$.
- What if say $\kappa_n = 0$? i.e. *M* has a zero mode?

In that case

$$Z = \int \left(\prod_{i=1}^{n-1} dx_i e^{-\kappa_i x_i^2}\right) \int dx_n = \left(\det' M\right)^{-\frac{1}{2}} \int dx_n.$$

We thus find

$$\ln Z = -\frac{1}{2}\ln \det' M + \ln \left(\int dx_n\right)$$

The One-Loop Determinant

One-loop corrections about a saddle-point are contained in the determinant

$$\mathcal{Z}_{1-\ell} = \det^{-\frac{1}{2}}(D)$$
.

Further: define the (integrated) heat kernel

$$K(t)=\sum_{m}d_{m}e^{-t\kappa_{m}}.$$

In this case

$$\ln \det D = \int_0^\infty \frac{dt}{t} K(t)$$

Importantly, for us

$$\ln \mathcal{Z} = \frac{1}{2} K(0; t) \ln A + \cdots$$

Only the t^0 term in K(t) contributes to the log term in the QEF saddle–points.

Scalar on S^2/\mathbb{Z}_N

Strategy

• Final computation on $(AdS_2 \otimes S^2) / \mathbb{Z}_N \Rightarrow$ non-compact.

$$a^2 \left(d\eta^2 + \sinh^2 \eta d\theta^2 \right) + a^2 \left(d\chi^2 + \sin^2 \chi d\phi^2 \right); \quad (\theta, \phi) \mapsto \left(\theta + \frac{2\pi}{N}, \phi - \frac{2\pi}{N} \right)$$

• Note the analytic continuation from S^2

$$a^2 \left(d\chi^2 + \sin^2 \chi d heta^2
ight) \mapsto a^2 \left(d\eta^2 + \sinh^2 \eta d heta^2
ight),$$

when $a \mapsto ia$, $\chi \mapsto i\eta$.

- Hence compute on $\mathsf{S}^2\otimes\mathsf{S}^2$ and analytically continue.
- Also have to impose the \mathbb{Z}_N orbifold.
- Consider the toy example of the scalar on S^2/\mathbb{Z}_N here.

Shailesh Lal

Zero Mode Contribution

Log Terms fo $\mathcal{N} = 2, 4, 8$ Supergravity

The Twisted QEF

Conclusions

Scalar on S^2/\mathbb{Z}_N

The spectrum of the scalar Laplacian on S^2 :

- Eigenvalues: $E_{\ell} = \ell (\ell + 1)$
- Eigenfunctions: $Y_{\ell,m}(\psi,\phi) = P_{\ell}^m e^{im\phi}, \quad -\ell \leq m \leq \ell.$

The heat kernel is

$$K(t) = \sum_{\ell=0}^{\infty} \sum_{m=-\ell}^{\ell} 1 \cdot e^{-\frac{t}{a^2}\ell(\ell+1)}$$

The
$$\mathbb{Z}_N$$
 orbifold:

$$\phi \mapsto \phi + \frac{2\pi}{N}$$

No change in eigenvalues

• Modes restricted to m = Np, $p \in \mathbb{Z}$, $-\ell \le m \le \ell$, The degeneracy changes:

$$d_{\ell} = \sum_{m=-\ell}^{\ell} \delta_{m,Np}.$$

The Analytic Continuation to AdS₂

The Heat Kernel on $\mathsf{S}^2/\mathbb{Z}_N$ has the form

$$K_{S^2/\mathbb{Z}_N}(t) = \frac{1}{N}K_{S^2} + \text{conical terms.}$$

To analytically continue to AdS₂,

- $K_{S^2} \mapsto K_{AdS_2}$,
- $a \mapsto ia$ in conical terms
- multiply conical terms by half.

This because S^2 has two fixed points, AdS_2 has one. We then find

$$\boxed{\mathcal{K}_{\mathsf{AdS}_{2}/\mathbb{Z}_{N}}\left(t\right)=\frac{1}{N}\mathcal{K}_{\mathsf{AdS}_{2}}+\frac{1}{2}\frac{N^{2}-1}{6N}+\mathcal{O}\left(t\right)}$$

This is how we compute on the NHG as well.

Also, similar expressions \Rightarrow holographic Wilson Loop Computations, $\frac{1}{N}$ Corrections. [Tseytlin, Buchbinder]

New Saddle Points

Consider the AdS_2 metric in coordinates $\sigma = \cosh \eta$.

$$ds^2 = a^2 \left(rac{d\sigma}{\sigma^2 - 1} + (\sigma^2 - 1) d\theta^2
ight), \quad heta \in [0, 2\pi)$$

Suppose we identify $\theta \mapsto \theta + \frac{2\pi}{N}$. Also, rescale coordinates on the quotient space, AdS_2/\mathbb{Z}_N .

$$\tilde{\sigma} = \frac{\sigma}{N}, \quad \tilde{\theta} = N\theta,$$

Then the metric becomes

$$ds^2 = a^2 \left(\frac{d\tilde{\sigma}^2}{\tilde{\sigma}^2 - \frac{1}{N}} + \left(\tilde{\sigma}^2 - \frac{1}{N} \right) d\tilde{\theta}^2 \right), \tilde{\theta} \equiv \tilde{\theta} + 2\pi.$$

Hence, this is a new spacetime which is asymptotically AdS_2 . \Rightarrow should be included in the QEF.
